Psychological ownership influences perceived legal ownership of patient medical data

Abstract

We propose beliefs about legal ownership are influenced by psychological ownership and cues that imbue it—knowledge, control, and self-investment. Legal ownership of medical data in the United States is determined by property rights afforded by HIPAA to three stakeholders: patients, medical providers, and health systems. We theorize that stakeholders underestimate patient rights and overestimate provider rights afforded by HIPAA because patients are perceived to have less knowledge, control, and to have invested less in their data. As predicted, stakeholders underestimated patient rights and overestimated provider rights afforded by HIPAA in a nationally representative sample of patients (*N*=300) and convenience samples of medical providers (*N*=114) and health systems administrators (*N*=100). We found additional evidentiary support for our process account in three experiments (*N*=1195) manipulating perceived knowledge, control, and self-investment, which modulated the degree to which patients underestimated rights afforded to them by HIPAA.

Keywords

Psychological ownership, legal ownership, knowledge, control, self-investment, patients, medical providers, health systems.

Introduction

In the context of patient medical data, we test whether psychological ownership and the cues that imbue it inform and bias perceptions about legal ownership. Psychological ownership is the feeling that a thing is MINE. Legal ownership is generally attributed to persons or organizations who possess a "bundle" of property rights (Demsetz, 1974). Under the Health Insurance Portability and Accountability Act (HIPAA), legal ownership of medical data includes property rights to use, control use, modify, sell, destroy, and transfer rights to other parties (Byrne, 2016; Oakley, 2023). HIPAA affords different bundles of property rights to three stakeholders: patients, medical providers, and health systems. The complexity of laws governing patient medical data often leaves stakeholders confused about these rights (Woelfel, 2005), which creates problems for data privacy, equity, and governance (Price & Cohen, 2019). We suggest that psychological ownership informs and biases stakeholder beliefs about their rights. Three cues imbue psychological ownership for objects, ideas, and rights from childhood to adulthood: perceived control, knowledge, and self-investment (Morewedge, 2021; Pierce et al., 2001). We theorize that because relative to patients, medical providers are in a position of greater control, knowledge, and invest more resources into medical data than patients, rights afforded to medical providers are overestimated and rights afforded to patients are underestimated.

We first test our theory with a survey of US residents including a nationally representative sample of patients (N = 300) and convenience samples of medical providers (N = 114) and health systems administrators (N = 100). We find that stakeholders underestimate patient rights and overestimate medical provider rights afforded by HIPAA. This is not due to a confusion between perceived rights and perceived fairness. All stakeholders agree that HIPAA should afford additional rights to patients and reduce the rights afforded to health systems. In three experiments with US nationally representative samples, we manipulate the

cues found to imbue psychological ownership—perceived knowledge, control, and self-investment (Morewedge, 2021; Pierce et al., 2001), which influences the degree to which patients underestimate the rights HIPAA affords them.

Psychological and Legal Ownership

Ownership can be legal, psychological, or both (Morewedge, 2021). Legal ownership is attributed to persons and organizations possessing one or more "sticks in a bundle" of property rights such as the property rights to use, control use, modify, sell, destroy, and transfer rights to other parties. People also experience feelings of psychological ownership for material, experiential, and abstract possessions (Dawkins et al., 2017; Pierce et al., 2001, 2003) from everyday household items to public parks and ideas (Morewedge & Giblin, 2015; Nancekivell et al., 2019; Ritov & Schurr, 2020). Psychological ownership is described as the feeling that a thing is MINE, which typically involves an association between possessions and the self (Belk, 1988; Ye & Gawronski, 2016). Psychological ownership often rises and falls with the acquisition and loss of legal ownership, such as when one acquires or sells a good or service (Marzilli Ericson & Fuster, 2014), but the two are distinct concepts (Friedman et al., 2018). People feel psychological ownership for things they don't legally own (e.g., companies in which they work) and legally own things that they don't feel are MINE (e.g., companies in which they hold stock).

We propose that psychological ownership and the cues that imbue it inform and bias perceptions of legal ownership, particularly when legal ownership is ambiguous. We test our theory by examining biases in perceived property rights afforded by HIPAA for patient medical data to three sets of stakeholders: patients, medical professionals, and health systems (e.g., hospitals and healthcare providers). Ownership of medical data is ambiguous and patients often do not know their legal rights (Balmer et al., 2010; Marshall & Barclay, 2003). As medical data is a product of patients who may know their health better than others (Belk,

1988), stakeholders may overestimate the property rights afforded to patients by HIPAA (Belk, 1988). We propose that healthcare providers should be more likely than patients to overestimate their rights, however, because providers experience higher levels of three cues to psychological ownership for patient data—perceived control (Nancekivell et al., 2019; Peck & Shu, 2009), subjective (medical) knowledge (Pierce et al., 2001, 2003), and self-investment (Kanngiesser et al., 2010; Norton et al., 2012).

Medical providers are typically the authority in patient-provider relationships (Popowicz, 2021), whereas patients generally lack control and autonomy (Goodyear-Smith & Buetow, 2001). Providers control patient medical data by collecting, classifying, reading, reporting, and modifying it. This dynamic is likely to bias perceived control and psychological ownership towards providers because, from early childhood, perceiving one has control over a thing creates a feeling that it is MINE (Espinosa & Starmans, 2020; Nancekivell et al., 2019). Perceived control can be instantiated through direct physical contact, such as touching, holding, or repeatedly using an object, or by touching its virtual representation on a screen (Peck & Shu, 2009). Control can also be instantiated by determining who, when, and how others can access an object or experience (Neary et al., 2009). HIPAA allows patients to request a copy of their electronic health records, but few patients do, whereas providers regularly use patient electronic health records, for example, and patients may request changes to their electronic health records but those changes are made by their providers. Second, medical providers are likely to possess greater professional knowledge and expertise than patients regarding the content and systems used to collect and maintain patient medical data. Greater subjective knowledge should imbue providers with a greater sense of psychological ownership over medical data than patients (Pierce et al., 2001, 2003). Third, patient medical data is generally contained in electronic health records.

Providers and their employees typically invest more labor, time, and financial resources in the creation and maintenance of patient medical data than do patients.

We suggest that the directionality of these cues inform and bias the rights that stakeholders believe are afforded by HIPAA to patients and medical providers. Given the higher perceived control, subjective knowledge, and self-investment experienced by providers than patients, we theorize that stakeholders underestimate the rights afforded to patients and overestimate the rights afforded to medical providers by HIPAA. Furthermore, we predict that variation in psychological ownership cues—perceived control, subjective knowledge, and self-investment—modulate the severity of these biased beliefs.

Study 1: Psychological Ownership Biases Legal Ownership

In Study 1, we tested our main predictions that stakeholders underestimate the number of rights afforded by HIPPA to patients, and overestimate the number of rights afforded by HIPPA to medical providers. To inform health policy reform, we also examined biases in the perceived rights afforded by HIPPA to health systems.

Methods

We recruited a total of 514 American participants, divided into three samples. Through Survey Health Global we recruited 114 primary care physicians and 100 health systems administrators (e.g., hospitals). We recruited our patient sample through Lucid Theorem, which consisted of a nationally representative sample of 300 Americans with respect to age, gender, ethnicity, and geography.

We measured perceptions of current and ideal property rights afforded by HIPAA to each group of stakeholders. We explicitly asked participants to evaluate the rights that each stakeholder *currently* possesses and *should* possess to make their distinction clear and address potential response bias. Measuring how property rights should ideally be afforded had the added benefit of identifying cases in which HIPAA and a stakeholder consensus diverge,

informing health policy reform. Participants reported the current and ideal rights afforded by HIPAA to each of three stakeholder groups—patients, medical providers, and health systems in a 2 (ownership: current, ideal) x 6 (property rights) within-subject design. These questions are listed in Table 1 (for all stimuli see Supplementary Table 1). For each of the 12 questions, participants could select multiple stakeholders (e.g., "patients", "medical providers" or "health systems"). Current and ideal rights afforded by HIPAA were presented in counterbalanced blocks.

Table 1. Perceived legal ownership measures and actual ownership by stakeholders (Study 1)

	Perceived ownership	**Actual ownership**		
Right #	**Current condition [ideal condition]**	**Patient**	**Medical Provider**	**Health systems**
Right #1: Access	Subject to some exceptions, who *currently* [*should*] possesses the legal right to access a patient's electronic health records data (e.g., view it)?	✓	✓	✓
Right #2: Control access	Subject to some exceptions, who *currently* [*should*] possesses the legal right to control access to a patient's electronic health record data (e.g., decide who can view it)?	✓	×	✓
Right #3: Profit	Subject to some exceptions, who *currently* [*should*] possesses the legal right to profit from or commercialize a patient's electronic health records data (e.g., by selling it)?	✓	×	✓
Right #4: Modify	Subject to some exceptions, who *currently* [*should*] possesses the legal right to modify a patient's electronic health records data (e.g., correct errors, make changes)?	✓	✓	✓
Right #5: Destroy	Subject to some exceptions, who *currently* [*should*] possesses the legal right to destroy a patient's electronic health records data (e.g., delete all or part of it)?	×	×	×
Right #6: Transfer	Subject to some exceptions, who *currently* [*should*] possesses the legal right to transfer their property rights for a patient's electronic health records data (e.g., selling their own interest in that particular record)?	×	×	✓
Actual number of rights afforded to stakeholders by HIPPA		4	2	5

Note: Actual ownership was determined by the second and third author, practicing lawyers with expertise in health policy law.

Table 2. Demographics by sample (Study 1)

Variables	**Patient sample (N=300)**	**Medical provider sample (N = 114)**	**Health systems administrators sample (N = 100)**
Gender			
Male	47%	67%	52%
Female	53%	29%	46%

Medicare	31%	12%	7%
Private	32%	85%	87%
Other	7%	2%	4%
None	8%	1%	0%
Prefer not to answer	0%	0%	2%
Political orientation (1: liberal to 7: conservative)	m = 4.43	m = 4.61	m = 4.83
Health status (1: poor to 5: excellent)	m = 3.12	m = 4.03	m = 4.07

We collected additional demographic variables at the end of the survey including *gender* (male, female, non-binary), *age* (18-24, 25-34, 35-44, 45-54, 55-64, 65+), *health*

status (Would you say your health in general is? 1 = poor, 2 = fair, 3 = good, 4 = very good, 5 = excellent), *insurance provider* (Medicaid, Medicare, Private, Other, None), *race* (American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Pacific Islander, White, Other), *political orientation* (Please locate yourself on the following scale of political orientation: 1 = extremely liberal to 7 = extremely conservative), and *income* (<15k, 15k-29.9k, 30k-44.9k, 45k-59.9k, 60k-74.9k, 75k-99.9k, 100k-149.9k, 150k+). See Table 2.

Results

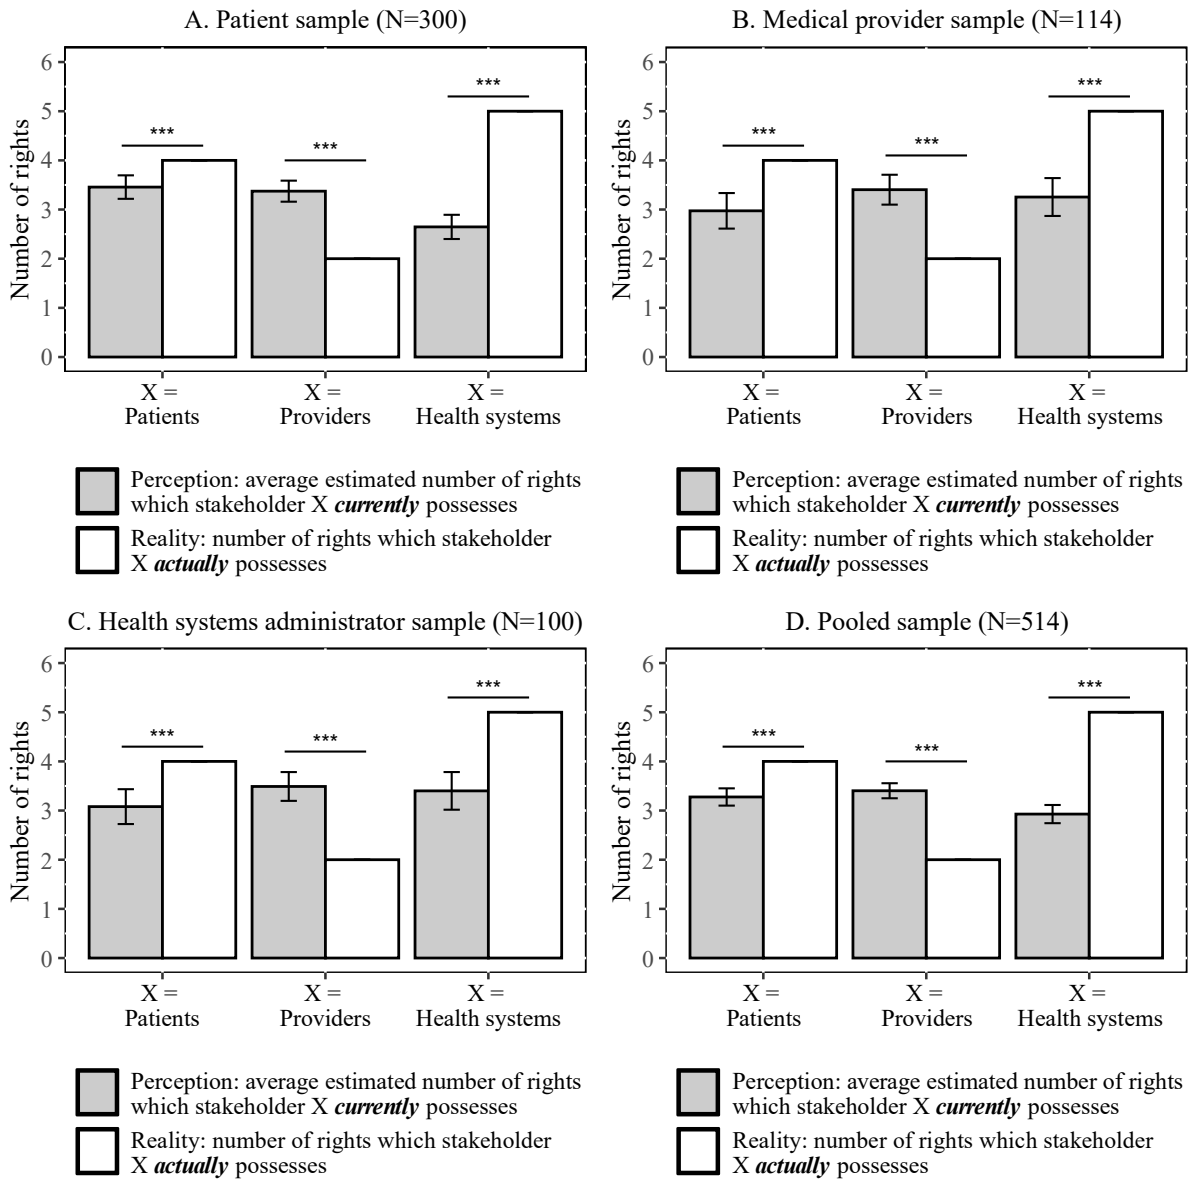
We first examined bias and accuracy by comparing (i) the perceived number of rights afforded to each group of stakeholders by HIPAA and (ii) the actual number of rights legal afforded to each group of stakeholders by HIPAA. The comparison is plotted in Figure 1 for patients (Panel A), medical providers (Panel B), health systems administrators (Panel C), and the pooled sample (Panel D). We used one-sample t-tests to identify departures from accuracy (i.e., 0); negative values indicate underestimation, and positive values indicate overestimation. We find a similar pattern of results when considering an alternative accuracy measure, the difference between the percentage of rights correctly afforded to each stakeholder and the actual percentage of rights afforded to each stakeholder (e.g., Supplementary Tables 2-4).

Patient Sample (n = 300). Patients underestimated the rights that HIPAA affords them (β = -0.53, $t(299)$ = -4.46, $p < 0.001$). Patients overestimated the rights afforded by HIPAA to medical providers (β = 1.37, $t(299)$ = 12.56, $p < 0.001$), and underestimated the rights afforded by HIPAA to health systems (β = -2.35, $t(299)$ = -18.74, $p < 0.001$).

Medical Provider Sample (n = 114). Doctors underestimated the rights that HIPAA affords to patients (β = -1.03, $t(113)$ = -5.56, $p < 0.001$), overestimated the rights afforded by HIPAA to medical providers (β = 1.40, $t(113)$ = 9.05, $p < 0.001$), and underestimated the rights afforded by HIPAA to health systems (β = -1.75, $t(113)$ = -8.88, $p < 0.001$).

Health Systems Administrator Sample (n = 100). Health systems administrators underestimated the rights that HIPAA affords to patients (β = -0.92, $t(99)$ = -5.09, $p < 0.001$), overestimated the rights afforded by HIPAA to medical providers (β = 1.49, $t(99)$ = 9.97, $p < 0.001$), and underestimated the rights afforded by HIPAA to health systems (β = -1.60, $t(99)$ = -8.19, $p < 0.001$).

Figure 1. Perceived versus actual legal rights afforded by stakeholders (Study 1)



Note: error bars +/- 1 SEM.

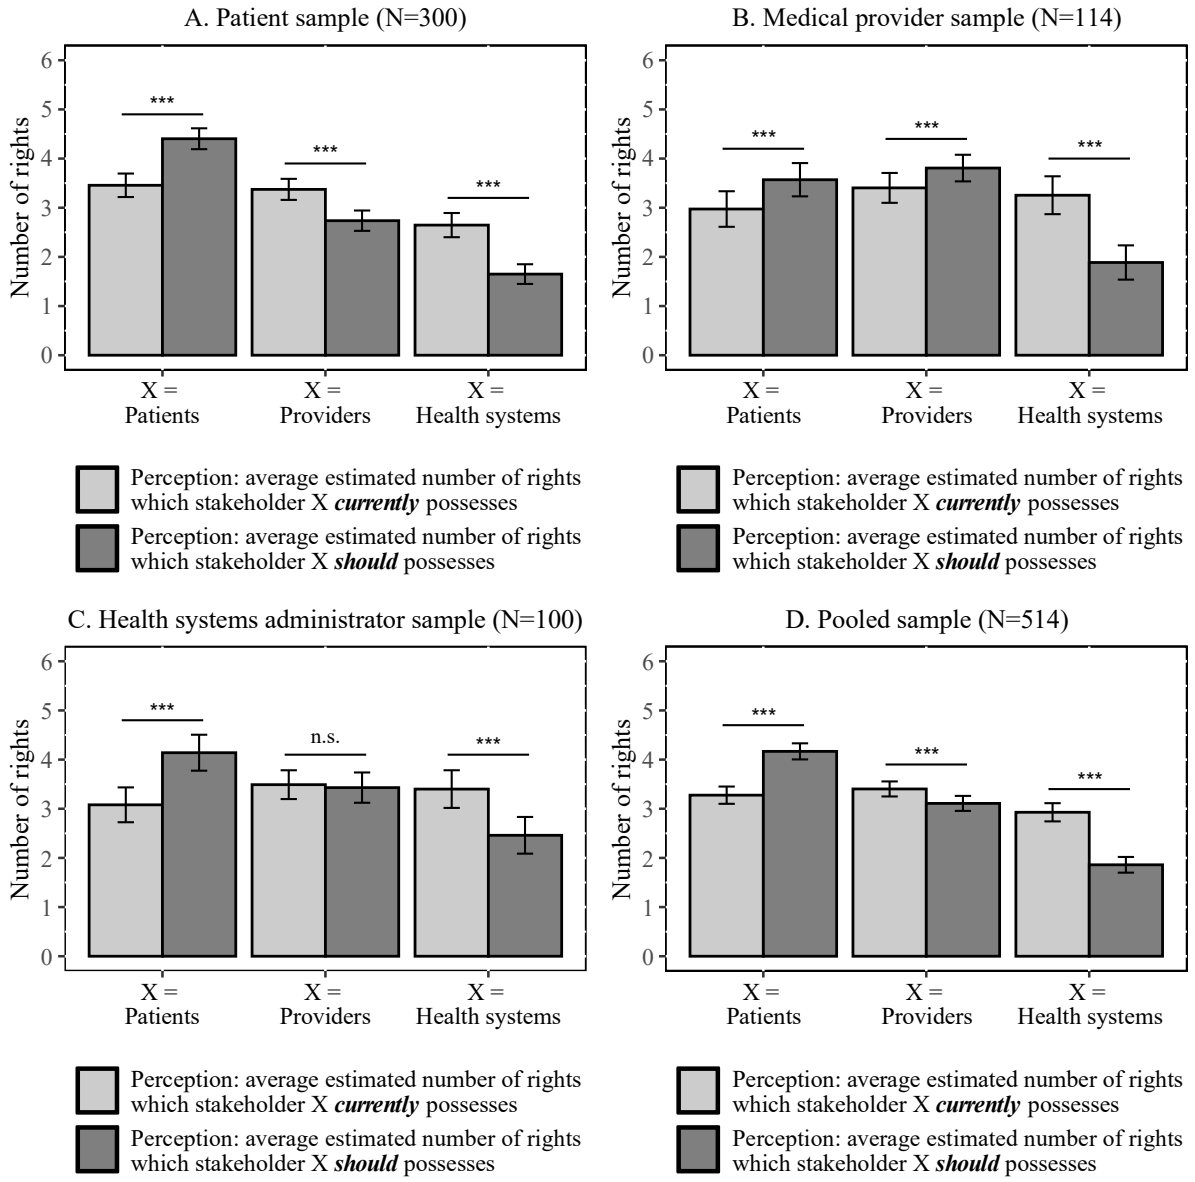
Pooled Sample. Taken together, all stakeholders underestimated the rights that HIPAA affords to patients (β = -0.72, t(513) = -8.08, p < 0.001), overestimated the rights afforded by HIPAA to medical providers (β = 1.40, t(513) = 17.99, p < 0.001), and underestimated the rights afforded by HIPAA to health systems (β = -2.07, t(513) = -21.96, p < 0.001).

Accuracy comparisons between samples. Medical providers were more likely than patients to underestimate patient rights (β = -0.48, t(511) = -2.17, p = 0.030), but health systems administrators were no more likely than patients to underestimate patient rights (β = -0.38, t(511) = -1.61, p = 0.107). Providers and patients were similarly likely to overestimate medical provider rights (p = 0.877), as were health systems administrators and patients (p = 0.569). Underestimation of rights afforded to health systems was more pronounced in the provider than patient samples (β = 0.61, t(511) = 2.61, p = 0.009), and in the health systems administrator than patient samples (β = 0.75, t(511) = 3.08, p = 0.002).

Current and ideal rights. As a comprehension check and to inform health policy reform, we compared the rights that participants believed HIPAA *does* afford and the rights that participants believed HIPAA *should* afford to each stakeholder group by sample (Figure 2). All stakeholders believed that patients should have more rights than they are currently afforded by HIPAA (m_{should} = 4.17 vs. $m_{current}$ = 3.28, t(513) = 10.25, p < .001). There was no consensus about the rights medical providers should by afforded. Patients believed medical providers should have fewer rights than they are currently afforded (m_{should} = 2.74 vs. $m_{current}$ = 3.37, t(299) = -5.25, p < .001). Medical providers believed they should have more rights than they are currently afforded (m_{should} = 3.81 vs. $m_{current}$ = 3.40, t(113) = 2.85, p = .005), and health systems administrators believed medical providers should have as many rights as they are currently afforded (m_{should} = 3.43 vs. $m_{current}$ = 3.49, t(99) = -.39, p = .699). Paired sample t-tests revealed agreement among all stakeholders that health systems should have *fewer*

rights than they are currently afforded (m_{should} = 1.86 vs. $m_{current}$ = 2.93, $t(99) = -5.65$, $p < .001$).

Figure 2. Current versus ideal rights afforded by stakeholders (Study 1)



Note: error bars +/- 1 SEM.

Discussion

Consistent with a psychological ownership account, all stakeholders exhibited biases in the rights they believe HIPAA affords to doctors and patients. Doctors, patients, and health systems administrators overestimated the rights HIPAA affords to doctors, who are in a

greater position of control, knowledge, and self-investment, and underestimated the rights that HIPAA affords to patients. Participants appeared to understand these assessments concerned the present rights of stakeholders rather than what is fair, as all stakeholders also agreed that patients should be afforded more rights and that health systems should afforded fewer rights. In the experiments that follow, we directly test our process account by experimentally manipulating cues that imbue psychological ownership (i.e., knowledge, control, and self-investment) and testing the influence of these manipulations on the number of legal rights attributed to patients.

Studies 2-4: Cues to Psychological Ownership Influence Perceived Legal Ownership

In Study 2, we examined how manipulating perceived control over electronic health records influences the perceived rights afforded to patients by HIPAA. We predicted that patients would believe fewer rights are afforded to them by HIPAA when felt less than more control over their electronic health records. In Study 3, we examined how manipulating subjective knowledge of electronic health records influences the perceived rights afforded to patients by HIPAA. We predicted that patients would believe fewer rights are afforded to them by HIPAA when felt less than more knowledgeable about their electronic health records. In Study 4, we examined how manipulating perceived self-investment in electronic health records influences the perceived rights afforded to patients by HIPAA. We predicted that patients would believe fewer rights are afforded to them by HIPAA when felt they had invested less rather than more resources in their electronic health records.

Study 2: Perceived Control and Legal Ownership

Method

Manipulation Pretest

We requested 200 and recruited 202 participants for a pretest from Prolific Academic (m_{age} = 40.17, 64% female). In a between-subjects design, participants were randomly assigned to a high or low control condition in which they completed manipulations adapted from Whitson and Galinsky (2008). In the high control condition, we asked participants to, "*Write about the ways in which you have control in creating, accessing, and maintaining your electronic medical records.*" In the low control condition we asked participants to, "*Write about the ways your healthcare providers have control in creating, accessing, and maintaining your electronic medical records.*" All responses were recorded in an open-ended text box (see full stimuli in Supplementary Table 6). We measured perceived control over electronic health records on a 7-point scale with endpoints, 1 (not at all) and 7 (completely). Perceived control was greater in the high control condition than in the low control condition ($m_{high\ control}$ = 4.04, se = 0.18, $m_{low\ control}$ = 3.10, se = 0.16, β = -0.94, $t(200)$ = -3.87, p < 0.001).

Table 3. Summary of the results from Studies 2-4

	Study 2 Control	**Study 3 Knowledge**	**Study 4 Self-investment**
Manipulation pretests: *N*	202	200	199
Low cue condition: *M* (se)	3.10 (0.16)	3.82 (0.11)	2.74 (0.12)
High cue condition: *M* (se)	4.04 (0.18)	4.01 (0.10)	3.21 (0.12)
Difference: *M* (*p*-value)	0.94 (p<.001)	0.19 (*p*=0.011)	0.47 (p=.006)
Focal Experiments: *N*	401	400	394
Low cue condition: *M* (se)	3.44 (0.12)	3.50 (0.13)	3.77 (0.11)
High cue condition: *M* (se)	3.84 (0.13)	3.87 (0.12)	4.19 (0.12)
Pre-registered difference: *M* (*p*-value)	0.44 (p=0.020)	0.36 (p=0.039)	0.42 (p=0.012)

Focal Experiment

We requested 400 participants and recruited 401 participants from a US nationally representative sample on Prolific Academic (m_{age} = 45.78, 50% female). In a between-subjects design, participants were randomly assigned to a high or low control condition in

which they completed the corresponding manipulations described in the pretest. All participants then reported their beliefs about the legal rights attributed to patients, medical providers, and health systems, as in Study 1.

Results

As preregistered, we regressed the number of legal rights afforded to patients on the perceived control manipulation (1 = high control condition, 0 = low control condition). As predicted, participants believed HIPPA affords fewer rights to patients in the low control condition ($m_{low\ control}$ = 3.44, *se* = 0.12) than in the high control condition ($m_{high\ control}$ = 3.84, *se* = 0.13, β = -0.40, $t(399)$ = -2.34, p = 0.020). Exploratory analyses reveal that participants also believed HIPPA affords more rights to medical providers in the low control condition (m_{low} = 3.65, *se* = 0.11) than in the high control condition (m_{high} = 3.34, *se* = 0.11, β = 0.31, $t(399)$ = 2.04, p = 0.042).

Study 3: Subjective Knowledge and Legal Ownership

Method

Manipulation Pretest

We requested and recruited 200 participants for a pretest from Prolific Academic (m_{age} = 39.53, 56% female). We measured subjective knowledge of electronic health records ("How well do you feel like you understand how your electronic health records are created, stored, and managed?") on a 7-point scale with endpoints, 1 (not well at all) and 7 (extremely well). Participants reported subjective knowledge before and after completing an intervention adapted from those used to reduce illusory subjective understanding (Cadario et al., 2021; Fernbach et al., 2013; Rozenblit & Keil, 2002).

> "*We would like you to explain how your electronic health records are created, stored, and managed. Creation: Who creates your electronic health records? Storage: Where are your electronic health records stored? Management: Who can access and*

determine access to your electronic health records? Who can modify your electronic health records? Please describe all the details about each question."

As expected, the manipulation reduced self-assessed subjective knowledge (m_{before} = 4.01, se_{before} = 0.10, m_{after} = 3.82, se_{after} = 0.11, $t(199) = -2.56$, $p = 0.011$).

Focal Experiment

We requested and recruited 400 participants from a US nationally representative sample on Prolific Academic (m_{age} = 45.76, 49% female). In a between-subjects design, participants were randomly assigned to a low or high perceived knowledge condition. In the low knowledge (treatment) condition, participants completed the manipulation designed to reduce subjective knowledge of electronic health records (see Supplementary Table 5). In the high knowledge condition, participants provided no explanation of their understanding of electronic health records; they immediately completed the dependent measures. All participants then reported their beliefs about the legal rights attributed to patients, medical providers, and health systems, as in Study 1.

Results

As preregistered, we regressed the number of legal rights afforded to patients on the subjective knowledge manipulation (1 = low knowledge condition, 0 = high knowledge condition). As predicted, participants believed HIPPA affords fewer rights to patients in the low knowledge condition ($m_{low\ knowledge}$ = 3.50, se = 0.13) than in the high knowledge condition ($m_{high\ knowledge}$ = 3.87, se= 0.12, β = -0.36, $t(397) = -2.07$, $p = 0.039$). Exploratory analyses reveal that participants also believed HIPPA affords more rights to medical providers in the low knowledge condition ($m_{low\ knowledge}$ = 3.44, se = 0.11) than in the high knowledge condition ($m_{high\ knowledge}$ = 3.14, se = 0.10, β = 0.30, $t(397) = 2.03$, $p = 0.043$).

Study 4: Self-Investment and Legal Ownership

Method

Manipulation Pretest

We requested 200 and recruited 199 participants for a pretest from Prolific Academic (m_{age} = 35.34, 56% female). In a between-subjects design, participants were randomly assigned to a high or low self-investment condition. In the high self-investment condition, we asked participants to "*Write about the ways in which you have invested time and effort in creating, accessing, and maintaining your electronic medical records*" followed by a text box. In the low self-investment condition, we asked participants to "*Write about the ways your healthcare providers have invested time and effort in creating, accessing, and maintaining your electronic medical records*" (see full stimuli in Supplementary Table 7). We measured perceived investment by patients, providers, and health systems ("To what extent have each of the following groups below invested effort in creating, accessing, and maintaining your electronic medical records?") on a 5-point scale with endpoints, 0 (none) and 4 (substantial effort). Perceived self-investment was lower in the low self-investment condition (m_{low} = 2.74, se_{low} = 0.12) than in the high self-investment condition (m_{high} = 3.21, se_{high} = 0.12, β = -0.47, $t(197)$ = -2.79, p = 0.006).

Focal Experiment

We requested 400 participants and recruited 394 participants from a US nationally representative sample on Prolific Academic (m_{age} = 45.93, 50% female). In a between-subjects design, participants were randomly assigned to a low or high self-investment condition. In the low self-investment condition, participants were asked to "*Write about the ways your healthcare providers have invested time and effort in creating, accessing, and maintaining your electronic medical records*" (see full stimuli in Supplementary Table 7). In the high self-investment condition, participants were asked to "*Write about the ways in which*

you have invested time and effort in creating, accessing, and maintaining your electronic medical records." Open-ended responses were recorded in a text box. All participants then reported their beliefs about the legal rights attributed to patients, medical providers, and health systems, as in Study 1.

Results

As preregistered, we regressed the number of legal rights afforded to patients on the self-investment manipulation (1 = high self-investment condition, 0 = low self-investment condition). As predicted, participants believed HIPAA affords fewer rights to patients in the low self-investment condition ($m_{low\ self\text{-}investment}$ = 3.77, se_l = 0.11) than in the high self-investment condition ($m_{high\ self\text{-}investment}$ = 4.19, se = 0.12, β = -0.42, $t(392)$ = -2.52, p = 0.012). Exploratory analyses revealed that participants did not believe HIPAA affords significantly more rights to medical providers in the low self-investment condition ($m_{low\ self\text{-}investment}$ = 3.33, se = 0.10) than in the high self-investment condition ($m_{high\ self\text{-}investment}$ = 3.11, se = 0.10, β = 0.22, $t(392)$ = 1.60, p = 0.111), although those these means were directionally consistent with the predictions of our theory.

Discussion

Cues giving rise to psychological ownership influenced perceived legal ownership of patient medical data. Manipulating perceived control, knowledge, and self-investment—cues that reliably induce psychological ownership (Morewedge, 2021; Pierce et al., 2001)—influenced the number of rights patients believed are afforded by HIPAA for their medical data. Manipulations that increased control, knowledge, and self-investment increased the number of rights patients believed are afforded by HIPAA, and manipulations that decreased these factors decreased the number of rights patients believed are afforded by HIPAA. HIPAA affords four rights to patients, so reducing perceived control, knowledge, and self-investment engendered more biased beliefs among patients.

General Discussion

In unique samples, our findings demonstrate that cues to psychological ownership can inform and bias perceptions of legal ownership in contexts where legal ownership is consequential. In a literature that typically examines how legal ownership influences psychological ownership (Marzilli Ericson & Fuster, 2014; Morewedge & Giblin, 2015), these findings provide evidentiary support for a theory that psychological ownership serves as an intuitive judgment of legal ownership, which informs and biases judgments of legal ownership when it is ambiguous (Morewedge, 2021).

Cues to psychological ownership underlie the different perspectives of interdependent stakeholders. Research exploring connections between legal and psychological ownership generally examines perceptions from a single viewpoint (Morewedge & Weiss, 2023). By investigating how multiple stakeholders (i.e., patients, medical providers, and health systems administrators) perceive ownership of medical data, we find evidence that different cue levels can create different perceptions of ownership across groups. Our approach highlights the complexities of ownership in multi-stakeholder environments and underscores the importance of considering multiple stakeholders in psychological ownership research.

We find patients are unaware of HIPAA rights they are free to exercise, and our findings suggest that medical providers and health systems administrators inaccurately inform patients about their rights. In Study 1, all three stakeholder groups overestimated the rights HIPAA affords to medical providers and underestimated the rights HIPAA affords to patients. All three groups also underestimated the rights HIPAA affords to health systems. This suggests that all three stakeholder groups could benefit from educational interventions that better inform them about the rights that HIPAA affords to stakeholders, such as including a summary of patient rights in HIPAA authorization forms.

We reveal a consensus among stakeholders for potential HIPAA reforms. All agree on expanding patient rights and curtailing the rights afforded to health systems. The US legal system typically supports data commercialization over privacy, making such policy changes challenging. The European Union’s General Data Protection Regulation (GDPR) is often considered a superior model for privacy (Forcier et al., 2019). All stakeholders believed patients should have the right to destroy and transfer their medical data, rights not currently provided by HIPAA but afforded in some measure by the GDPR. This could involve adopting rights similar to the GDPR's "right to be forgotten" and rethinking the monetization of patient data to better align with patients' interests. Practically, it may be more difficult to curtail the rights of health systems but there does appear to be a consensus that those rights could be scaled back, even amongst health systems administrators.

Finally, our findings suggest a framework for understanding biases in the inferences made by multiple stakeholders about the distribution of property rights. Our psychological ownership framework makes testable predictions by specifying the directional influence of cues including perceived control, familiarity and knowledge, and resource investment on the perception of property rights. Thus, our framework offers insights beyond health policy to more general inferences about property law and organizational governance.

Supplementary Information

Supplementary Table 1. Stimuli for Study 1

Page	Stimuli
1	Consent form + Do you work in the healthcare industry? (answers: “no”, “I have a clinical healthcare position such as doctor, nurse, therapist, etc.”, “I have an administrative healthcare position such as manager, assistant, coordinator, etc.”, “I have a technical healthcare position such as technician, technologist, etc.”, “I have another position in the healthcare industry not listed above”)
2	**Introduction** In this survey, you will answer questions about electronic health records (i.e., eHealth records). Electronic health records are a secure digital summary of health information. They are digital files containing information about health that are stored in patients' medical records.
3	**Instructions** In the next set of questions, we'd like you to tell us whether each of three different parties currently possesses different legal rights associated with your electronic health records (i.e., eHealth records). The three parties include: (i) Patients (e.g., you), (ii) Providers (e.g., doctors, nurses) and (iii) Health Systems (e.g., hospitals, insurers). For each question, please indicate whether you believe the party currently possesses the legal right associated to your electronic health records. You can select multiple parties. Subject to some exceptions, who currently possesses the legal right to access a patient's electronic health records data (e.g., view it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to control access to a patient's electronic health record data (e.g., decide who can view it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to profit from or commercialize a patient's electronic health records data (e.g., by selling it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to modify a patient's electronic health records data (e.g., correct errors, make changes)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to destroy a patient's electronic health records data (e.g., delete all or part of it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to transfer their property rights for a patient's electronic health records data (e.g., selling their own interest in that particular record)? ☐ Patients ☐ Providers ☐ Health Systems
4	[same as previous but with the word “should” instead of “currently” for all six questions. The order of pages 4 and 5 was randomized].
5	Demographics: gender (male, female, non-binary), age (18-24, 25-34, 35-44, 45-54, 55-64, 65+), health status (Would you say your health in general is? 1 = poor, 2 = fair, 3 = good, 4 = very good, 5 = excellent), insurance provider (Medicaid, Medicare, Private, Other, None), race (American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Pacific Islander, White, Other), political orientation (Please locate yourself on the following scale of political orientation: 1 = extremely liberal to 7 = extremely conservative), and income (<15k, 15k-29.9k, 30k-44.9k, 45k-59.9k, 60k-74.9k, 75k-99.9k, 100k-149.9k, 150k+).

Supplementary Table 2. Rights attributed to patients by sample (Study 1)

	Patient sample (N=300)	**Medical provider sample (N=114)**	**Health systems admin. sample (N=100)**	**Pooled sample (N=514)**
#1 Right to access a patient's EHR data (✓)				
Patients currently possess that right	73%	82%	91%	78%
Patients should possess that right	83%	82%	89%	84%
#2 Right to control access to a patient's EHR data (✓)				
Patients currently possess that right	64%	59%	59%	62%
Patients should possess that right	79%	65%	77%	75%
#3 Right to profit from patient's EHR data (✓)				
Patients currently possess that right	47%	43%	35%	44%
Patients should possess that right	69%	68%	73%	70%
#4 Right to modify a patient's EHR data (✓)				
Patients currently possess that right	48%	35%	32%	42%
Patients should possess that right	60%	31%	44%	50%
#5 Right to destroy a patient's EHR data (✗)				
Patients currently possess that right	53%	32%	35%	45%
Patients should possess that right	70%	50%	57%	63%
#6 Right to transfer rights for a patient's EHR data (✗)				
Patients currently possess that right	60%	47%	56%	57%
Patients should possess that right	79%	61%	74%	74%
A = % of rights correctly attributed to patients	53%	57%	54%	54%
B = actual % of rights attributed to patients (4/6)	66.7%	66.7%	66.7%	66.7%
A-B (* $p < 0.05$)	-13%*	-10%*	-12%*	-12%*

Note: (✓) means that patients currently possess that right in reality, and (✗) means that patients do not currently possess that right in reality. For each of the six legal rights, we report the percentage of participants who indicated that "patients" *currently possess* and *should possess* the right in question.

Supplementary Table 3. Rights attributed to medical providers (Study 1)

	Patient sample (N=300)	**Medical provider sample (N=114)**	**Health systems admin. sample (N=100)**	**Pooled sample (N=514)**
#1 Right to access a patient's EHR data (✓)				
Medical providers currently possess that right	73%	92%	96%	82%
Medical providers should possess that right	65%	97%	93%	78%
#2 Right to control access to a patient's EHR data (✗)				
Medical providers currently possess that right	55%	61%	55%	56%
Medical providers should possess that right	41%	75%	53%	51%
#3 Right to profit from patient's EHR data (✗)				
Medical providers currently possess that right	43%	22%	24%	34%
Medical providers should possess that right	30%	26%	24%	28%
#4 Right to modify a patient's EHR data (✓)				
Medical providers currently possess that right	70%	86%	94%	78%
Medical providers should possess that right	66%	93%	92%	77%
#5 Right to destroy a patient's EHR data (✗)				
Medical providers currently possess that right	52%	48%	48%	50%
Medical providers should possess that right	38%	52%	49%	43%
#6 Right to transfer rights for a patient's EHR data (✗)				
Medical providers currently possess that right	44%	32%	32%	39%
Medical providers should possess that right	33%	37%	32%	34%
A = % of rights correctly attributed to providers	58%	69%	72%	63%
B = actual % of rights attributed to providers (2/6)	33.3%	33.3%	33.3%	33.3%
A-B (* $p < 0.05$)	+25%*	+36%*	+39%*	+30%*

Note: (✓) means that medical providers currently possess that right in reality, and (✗) means that medical providers do not currently possess that right in reality. For each of the six legal rights, we report the percentage of participants who indicated that "medical providers" *currently possess* and *should possess* the right in question.

Supplementary Table 4. Rights attributed to health systems (Study 1)

	Patient sample (N=300)	**Medical provider sample (N=114)**	**Health systems admin. sample (N=100)**	**Pooled sample (N=514)**
#1 Right to access a patient's EHR data (✓)				
Health systems currently possess that right	50%	65%	77%	59%
Health systems should possess that right	42%	51%	69%	49%
#2 Right to control access to a patient's EHR data (✓)				
Health systems currently possess that right	43%	58%	59%	49%
Health systems should possess that right	21%	36%	41%	28%
#3 Right to profit from patient's EHR data (✓)				
Health systems currently possess that right	49%	59%	59%	53%
Health systems should possess that right	25%	22%	26%	25%
#4 Right to modify a patient's EHR data (✓)				
Health systems currently possess that right	40%	39%	44%	40%
Health systems should possess that right	28%	20%	43%	29%
#5 Right to destroy a patient's EHR data (✗)				
Health systems currently possess that right	43%	53%	57%	48%
Health systems should possess that right	28%	32%	40%	31%
#6 Right to transfer rights for a patient's EHR data (✓)				
Health systems currently possess that right	40%	53%	44%	43%
Health systems should possess that right	21%	28%	27%	24%
A = % of rights correctly attributed to health systems	46%	54%	54%	49%
B = actual % of rights attributed to health systems (5/6)	83.3%	83.3%	83.3%	83.3%
A-B (* $p < 0.05$)	-37%*	-29%*	-29%*	-34%*

Note: (✓) means that health systems currently possess that right in reality, and (✗) means that health systems do not currently possess that right in reality. For each of the six legal rights, we report the percentage of participants who indicated that "health systems" *currently possess* and *should possess* the right in question.

Supplementary Table 5. Stimuli for Study 2

Page	Stimuli
1	[Reduced knowledge condition] We would like you to explain how your electronic health records are created, stored, and managed. - Creation: Who creates your electronic health records? - Storage: Where are your electronic health records stored? - Management: Who can access and determine access to your electronic health records? Who can modify your electronic health records? Please describe all the details about each question. Important: please do not look up or google this topic online, as that would defeat the purpose of our survey. We are only interested in how people would answer this question to best of their knowledge. (50 characters minimum, validation available after 45 seconds) [text box] [Control condition: participants directly start on page 2]
2	**Instructions** In the next set of questions, we'd like you to tell us whether each of three different parties currently possesses different legal rights associated with your electronic health records (i.e., eHealth records). The three parties include - Patients (e.g., you) - Providers (e.g., doctors, nurses) - Health Systems (e.g., hospitals, insurers) For each question, please indicate whether you believe the party currently possesses the legal right associated to your electronic health records. You can select multiple parties. Subject to some exceptions, who currently possesses the legal right to access a patient's electronic health records data (e.g., view it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to control access to a patient's electronic health record data (e.g., decide who can view it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to profit from or commercialize a patient's electronic health records data (e.g., by selling it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to modify a patient's electronic health records data (e.g., correct errors, make changes)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to destroy a patient's electronic health records data (e.g., delete all or part of it)? ☐ Patients ☐ Providers ☐ Health Systems Subject to some exceptions, who currently possesses the legal right to transfer their property rights for a patient's electronic health records data (e.g., selling their own interest in that particular record)? ☐ Patients ☐ Providers ☐ Health Systems
3	Gender (male, female, non-binary), age (in years)
