Abstract

Background: Few sources regularly monitor hospitalizations associated with respiratory viruses. This study provides current hospitalization trends associated with six common respiratory viruses: COVID-19, influenza, human metapneumovirus (HMPV), parainfluenza virus, respiratory syncytial virus (RSV), and rhinovirus.

Objective: This study aims to supplement the surveillance data provided by the CDC by describing trends overall and for each respiratory virus. This study also provides valuable insight into two at-risk populations: infants and children (age 0-4) and older adults (age 65 and over).

Methods: Using a subset of real-world electronic health record (EHR) data from Truveta, a growing collective of health systems that provide more than 18% of all daily clinical care in the USA consortium of US healthcare systems, we identified people who were hospitalized between October 01, 2019 and December 31, 2023. We identified people who tested positive for any of the six respiratory virus within 14 days of the hospitalization. We report weekly trends in the rate of hospitalizations associated with each virus per all hospitalizations for the overall population and the two high-risk sub populations, infants and children and older adults.

Results: We included 502,484 hospitalizations of 471,401 unique patients who tested positive for a respiratory virus between October 01, 2019 and December 31, 2023.

Overall, the rate of hospitalizations associated with respiratory viruses continue to increase through the end of December 2023 (92.8% increase since November 2023). The largest increases over the past month have been seen in influenza- (251.7% increase), HMPV- (115.0% increase), and COVID-associated (88.6% increase) hospitalizations. For infants and children, RSV accounted for the most respiratory virus-associated hospitalizations, despite decreases throughout December 2023. In this population, COVID-associated hospitalizations had the biggest increase in the last month. For the older adult population, respiratory virus-associated hospitalizations increased to 10.3% per all hospitalizations. COVID remained the largest contributor; 5.3% of all hospitalizations were associated with COVID in the older adult population.

Discussion: Respiratory virus-associated hospitalizations continued to increase overall, including for the two high risk populations we studied. RSV-associated hospitalizations continue to be the main contributor to illness in infants and children, while COVID-associated hospitalizations are the largest contributor for the older adult population. We will continue to monitor trends in all respiratory viruses.

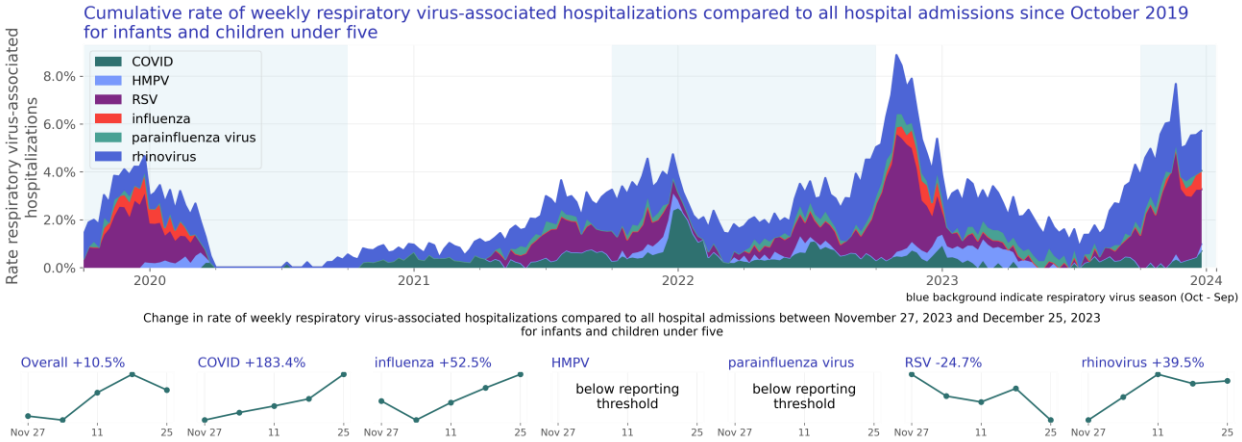
Trends in Surveillance

Overall population

	Overall	COVID	influenza	HMPV	parainfluenza virus	RSV	rhinovirus
November 27, 2023	4.01%	1.76%	0.84%	0.05%	0.10%	0.81%	0.58%
December 25, 2023	7.73%	3.31%	2.96%	0.10%	0.09%	0.93%	0.61%
Change (percentage)	+92.83%	+88.62%	+251.72%	+115.03%	-9.63%	+14.86%	+6.86%
Difference (percentage points)	+3.72%	+1.56%	+2.12%	+0.05%	-0.01%	+0.12%	+0.04%

Overall, the rate of hospitalizations associated with respiratory viruses continue to increase through the end of December 2023 (92.8% increase since November 2023). Specifically, COVID- (88.6%), influenza- (251.7%), and HMPV- (115.0%) associated hospitalization trends increased. COVID and influenza-associated hospitalizations are at 3.3% and 3.0% of all hospitalizations, respectively. Other viruses are each below 1% of hospitalizations. Nevertheless, at the end of December 2023, respiratory virus-associated hospitalizations accounted for 7.7% of all hospitalizations.

Infants and children (age 0-4)



medRxiv preprint doi: https://doi.org/10.1101/2024.01.20.24301528; this version posted January 22, 2024. The copyright holder for this preprint (which was not certified by peer review) is the author/funder, who has granted medRxiv a license to display the preprint in perpetuity. 	Overall	COVID	influenza	HMPV	parainfluenza virus	RSV	rhinovirus
November 27, 2023	4.59%	0.24%	0.51%	n/a	n/a	3.05%	1.19%
December 25, 2023	5.08%	0.69%	0.77%	0.29%	n/a	2.29%	1.66%
Change (percentage)	+10.53%	+183.40%	+52.48%			-24.70%	+39.51%
Difference (percentage points)	+0.48%	+0.45%	+0.27%			-0.75%	+0.47%

For the population between 0-4 years old, in December 2023, RSV accounted for the most respiratory virus-associated hospitalizations, despite decreasing rates since November 2023 (24.7% decrease). COVID- (183.5% increase), influenza- (52.5% increase), and rhino-associated (39.5% increase) hospitalizations are increasing in this population. In this age group, 5.1% of all hospitalizations were associated with respiratory viruses in December 2023, a 10.5% increase from November 2023.

Older adults (age 65 and over)

	Overall	COVID	influenza	HMPV	parainfluenza virus	RSV	rhinovirus
November 27, 2023	5.31%	2.90%	0.91%	0.07%	0.10%	0.84%	0.57%
December 25, 2023	10.29%	5.33%	3.33%	0.12%	0.09%	1.11%	0.56%
Change (percentage)	+93.71%	+83.52%	+267.84%	+76.00%	-12.54%	+32.53%	-1.82%
Difference (percentage points)	+4.98%	+2.42%	+2.43%	+0.05%	-0.01%	+0.27%	-0.01%

In the older adults population (individuals over 65 years of age), there was a 93.7% increase in hospitalizations associated with respiratory viruses; 10.3% of all hospitalizations are associated with a respiratory virus. Influenza-associated hospitalizations had the largest percent increase between November and December 2023 (267.8%). COVID-associated hospitalizations continue to make up the largest percentage of hospitalizations in this age group (5.3% in December).

Introduction

COVID, influenza, and RSV account for a large proportion of hospitalizations related to respiratory illnesses in the United States. To provide a more complete understanding of hospitalizations related to respiratory viruses, we have also included other viruses known to cause respiratory illness such as human metapneumovirus (HMPV), parainfluenza, and rhinovirus. Each of these viruses can lead to hospitalization and death especially in vulnerable populations, such as infants, children, and older adults (Pastula et al., 2017; Shi et al., 2017, Centers for Disease Control and Prevention 2023a, Smits et al., 2023). Representative and timely data to proactively monitor infections are scarce.

Respiratory viruses are also a major source of infection and hospitalizations in older adults (defined here as patients 65 years of age or older). Incidence has been estimated between 3-10% annually for RSV in older adults (Boyce et al., 2000) and 8-10% for influenza in adults (Tokars et al., 2018). Often, as is the case with influenza, older adults are at higher risk for hospitalization and death than other age groups (Czaja et al. 2019). There are comorbidities that are associated with increased hospitalization risk for older adults, such as congestive heart failure and chronic lung disease (Lee et al., 2013). Further, asthma, COPD, and congestive heart failure can exacerbate respiratory virus infections. Here we report counts for a selection of high-risk medical conditions such as chronic lung diseases and asthma.

Incidence rates in infants and children (defined here as individuals less than five years of age) with respiratory virus infections are higher than other age groups, except adults 65 and older (Centers for Disease Control and Prevention, 2023c; Centers for Disease Control and Prevention, 2023d). In the future, we plan to include high-risk comorbid states, such as congenital heart disease, preterm birth, and cystic fibrosis (Committee on Infectious Diseases and Bronchiolitis Guidelines Committee et al., 2014).

It is important for public health experts and clinical providers to understand the trends in these infections to inform decisions about public health, clinical care, and public policy. Connecting population-level trends with granular clinical information available in Truveta Studio can be very useful to more deeply understand which cohorts are most impacted.

This report is intended to supplement the surveillance data provided by the CDC (Centers for Disease Control and Prevention, 2023b). This report includes additional independent data and clinical detail that is not captured in other reports.

Methods

Data

We evaluated respiratory virus-associated hospitalization trends of six common respiratory viruses: COVID-19, influenza, human metapneumovirus (HMPV), parainfluenza virus, respiratory syncytial virus (RSV), and rhinovirus between October 01, 2019 and December 31, 2023 using a subset of Truveta Data. Truveta provides access to continuously updated, linked, and de-identified electronic health record (EHR) from a collective of US health care systems that provide 18% of all daily clinical care in the US, including structured information on demographics, encounters, diagnoses, vital signs (e.g., weight, BMI, blood pressure), medication requests (prescriptions), medication administration, laboratory and diagnostic tests and results (e.g., COVID tests and values), and procedures. Updated EHR data are provided daily to Truveta by constituent health care systems. The data used in this study was provided on January 15, 2024 and included de-identified patient care data primarily located across ten states: Texas, Virginia, New York, Florida, California, Michigan, Washington, North Carolina, Wisconsin, and Louisiana.

Population

We identified hospitalized patients who tested positive for one of the selected respiratory viruses within 14 days before or during the hospitalization. Positive lab results were identified using LOINC codes. Every respiratory virus-associated hospitalization has been grouped such that every hospitalization within 90 days is considered to be the same infection and thus only counted once. To align with seasonality in respiratory transmission, time periods include October 1st through September 30th of the following year.

Hospitalization rate analysis

Characteristics of respiratory virus-associated hospitalized patients were summarized, including demographics and comorbidities by respiratory virus season. Characteristics are provided for the overall population, individual viruses, and two at-risk sub populations: infants and children (age 0-4) and older adults (age 65 and over).

Respiratory virus-associated hospitalizations rates were summarized over time by virus. The hospitalization rate was calculated weekly as the number of patients with a respiratory virus associated hospitalization divided by the number of patients with a hospital admission in that week. Patients were included in this calculation on the first

day of their hospitalization. If their stay was greater than one day, they were not counted on subsequent dates.

Given the unadjusted nature of the data, the rates do not account for undertesting and other variability that exists across patient groups, providers, and systems. For further limitations, see the section below.

Results

Overall population

Our study population consists of 502,484 hospitalizations of 471,401 unique patients (Table 1).

Table 1: Patient characteristics by season.

	2019/2020	2020/2021	2021/2022	2022/2023	2023/2024	Overall

Older adults (age 65 and over)

Our older adults study population consists of 244,965 hospitalizations of 230,770 unique patients (Table 9).

Table 9: Older adults patient characteristics by season.

Hospitalization rate over time

The rate of respiratory virus-associated hospitalizations compared to all hospitalizations for adults 65 and over is shown in `Figure 17. Figure 18 shows the same data stacked to represent the combined impact of the viruses.

Figure 17: Rate of weekly respiratory virus-associated hospitalizations compared to all hospital admissions since October 2019 for adults 65 years or older

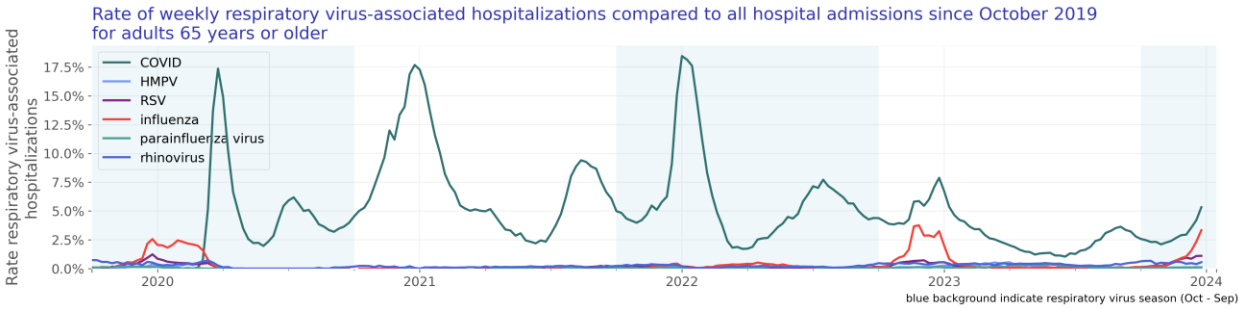

Figure 18: Cumulative rate of weekly respiratory virus-associated hospitalizations compared to all hospital admissions since October 2019 for adults 65 years or older

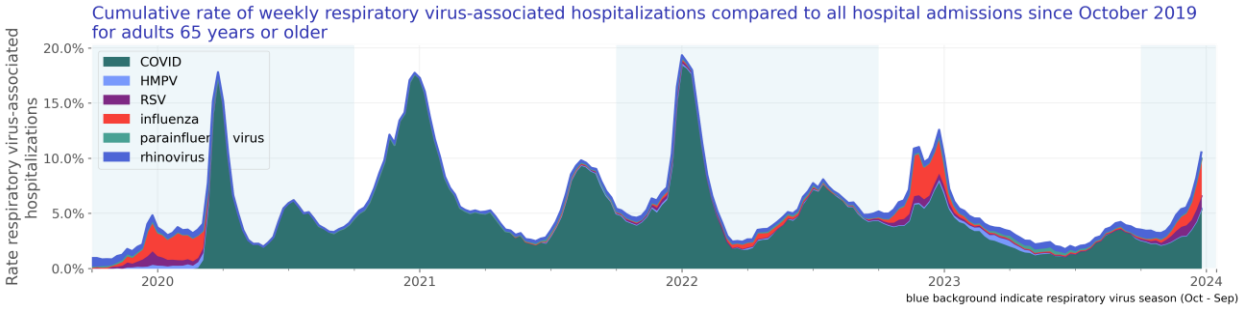

Discussion and Conclusion

Overall, the rate of hospitalizations associated with respiratory viruses continue to increase through the end of December 2023 (92.8% increase since November 2023). Specifically, COVID- (88.6%), flu- (251.7%), and HMPV- (115.0%) associated hospitalization trends increased. COVID and influenza-associated hospitalizations are at 3.3% and 3.0% of all hospitalizations, respectively. Other viruses are each below 1% of hospitalizations. Nevertheless, at the end of December 2023, respiratory virus-associated hospitalizations accounted for 7.7% of all hospitalizations.

For the population between 0-4 years old, in December 2023, RSV accounted for the most virus-associated hospitalizations, despite decreasing rates since November 2023 (24.7% decrease). COVID- (183.5% increase), influenza- (52.5% increase), and rhino-associated (39.5% increase) hospitalizations are increasing in this population. In this age group 5.1% of all hospitalizations were associated with respiratory viruses in December 2023, a 10.5% increase from November 2023.

In the older adults population (individuals over 65 years of age), there was a 93.7% increase in hospitalizations associated with respiratory viruses; 10.3% of all hospitalizations are associated with a respiratory virus. Influenza-associated

medRxiv preprint doi: https://doi.org/10.1101/2024.01.20.24301528; this version posted January 22, 2024. hospitalizations had the largest percent increase between November and December 2023 (267.8%). COVID-associated hospitalizations continue to make up the largest percentage of hospitalizations in this age group (5.3% in December).

Several limitations of our analysis should be noted. All data are preliminary and may change as additional data are obtained. These findings are consistent with data accessed January 15, 2024. These are raw counts and post-stratification methods have not been conducted. This analysis does not include patients hospitalized with a respiratory virus who were not tested or were tested later in their medical care (when laboratory tests results would have returned a negative result). In addition, cohorts with small counts may be suppressed during the de-identification process leading to the appearance of zero patients for a given time period. Moreover, the unknowns in this report either indicate the value was not included in the individual's electronic health record or that it was excluded from the data to protect an individual's identity as a part of Truveta's commitment to privacy (Truveta, 2024).

We will continue to monitor respiratory virus-associated hospitalization overall and for the at-risk populations.
