Abstract

The ClimateMind50+ questionnaire is a tailored instrument to assess the knowledge, concerns, preparedness, behaviours, and involvement of individuals aged 50 and above. Older adults are particularly vulnerable to climate-related hazards such as extreme heat, flooding, and severe storms, yet their perspectives and contributions to climate resilience remain underrepresented in research. The systematic development of the ClimateMind50+ involved rigorous cognitive testing with diverse participants, ensuring clarity, accessibility, and relevance. The tool is designed for versatility in administration—face-to-face, via telephone, or self-completion—facilitating its integration across various research contexts.

Cognitive testing highlighted the need for clear wording, simplified response scales, and age-appropriate framing of questions. For instance, questions on climate preparedness and sustainable practices were refined to capture lifetime actions ("ever") rather than limited timeframes, enhancing their relevance for older respondents. Additionally, the questionnaire effectively explores older adults' engagement in climate actions, from individual behavioural changes to advocacy and activism, challenging stereotypes of passivity in this demographic.

By providing nuanced insights into the experiences of older adults and their potential contributions to climate mitigation and adaptation, the ClimateMind50+ offers a robust foundation for climate change research among older people. Its deployment can support policymaking and community initiatives aimed at reducing climate risks while promoting sustainable and healthy aging practices. This innovative tool underscores the importance of amplifying the voices of older adults in climate discourse and harnessing their capacities for fostering resilience.

Introduction

The escalating challenges posed by climate change demand a nuanced understanding of its impacts on vulnerable populations, particularly older adults.[1] Older individuals are disproportionately affected by climate-related phenomena such as extreme heat, flooding, and severe weather, which exacerbate existing health conditions and introduce unique vulnerabilities.[1] Yet, despite their heightened risk, this demographic is often underrepresented in studies addressing the relationship of climate change and healthy aging.

We recently conducted a systematic mapping of aging studies[2] which revealed significant gaps in the integration of climate-related measures, with few studies employing questionnaires tailored to assess older adults' concerns, perceptions, preparedness, and behaviours regarding climate change. Existing tools are either outdated or not specifically designed for aging populations, limiting their capacity to capture the unique experiences and potential contributions of older people.

To address these gaps, this article introduces and describes in detail the development of a new, concise questionnaire specifically designed for individuals aged 50 and above, created for administration within the English Longitudinal Study of Ageing (ELSA)[3] and intended to be made available for use in other ageing studies. This tool aims to address critical dimensions such as climate worry, preparedness for extreme events, and engagement in climate action. By focussing on the experiences and perspectives of older adults, this questionnaire not only fills an empirical gap but also challenges prevailing stereotypes that marginalize this group as passive or disengaged in climate discourse. Moreover, it recognizes the untapped potential of older individuals as active participants in fostering sustainable practices and mitigating climate change. [4,5]

The questionnaire facilitates integration of age-specific climate data into research which in turn will help supporting evidence-based strategies to protect and empower vulnerable older populations in the face of a changing climate.

Methods

We reviewed the 153 ageing studies in three cohort consortiums (Integrative Analysis of Longitudinal Studies of Ageing and Dementia [IALSA],[6] Ageing Trajectories of Health: Longitudinal Opportunities and Synergies [ATHLOS],[7] and Gateway to Global Ageing Data[8]) and identified survey questions related to climate change.[2] Furthermore, we carried out additional searches to identify surveys and questionnaires used in general populations (of all ages) and government reports, with a particular focus on data from the UK and Europe. Based on the identified survey questions, the topics were categorised into four groups:

(1) Attitudes: Understanding Society - New module on environmental attitudes (2022),[9] Solastalgia,[10] Office for National Statistics Public attitudes to the environment and the impact of climate change, Great Britain (2021),[11] Department for Energy Security and Net Zero (DESNZ) and Department for Business, Energy and Industrial Strategy (BEIS) Public Attitude Tracker,[12] and Climate Change in the Irish Mind (CCIM);[13]

(2) Behaviours: General Ecological Behaviour Scale,[14] Sustainable consumption behaviour,[15] Understanding Society - Environmental behaviours,[8] and CCIM;[13]

(3) Worries: Climate change anxiety scale,[16] DESNZ/BEIS Public Attitude,[12] and CCIM;[13]

(4) Beliefs, perceptions and knowledge: Centre for Climate Change and Social Transformations (CAST),[17,18] Climate change and Net Zero: Public Awareness and Perceptions (2021),[19] European Perceptions of Climate Change (2016),[20] British Public

Perceptions of Climate Risk, Adaptation Options and Resilience (RESiL RISK) (2019),[21] CCIM,[13] and DESNZ/BEIS Public Attitude Tracker;[12]

The questions were meticulously reviewed and refined, with new ones developed to ensure their suitability for administration to older adults. This process involved consultation with experts in survey methods, climate change, gerontology, aging, social policy, and epidemiology. We carefully examined individual questions from existing surveys, selecting those most relevant to older individuals. The selected questions underwent thorough discussion, with modifications made to align with the requirements for administration in ageing studies. Multiple iterations were conducted to achieve a consensus on a finalized set of questions (Figure 1).

We then conducted cognitive testing interviews to explore how participants mentally processed the ClimateMind50+ survey questions, aiming to improve the clarity and effectiveness of survey designs. These interviews played a crucial role in understanding whether participants could interpret questions accurately, recall relevant information, and provide thoughtful responses. Rather than focusing on the specific answers given, the process investigated how individuals engaged with the survey itself, identifying potential barriers to comprehension or response accuracy.

Each interview was conducted one-on-one to allow for an in-depth exploration of the participant's thought process. Participants were encouraged to articulate their understanding of the questions, describe how they recalled the necessary information, and explain their decision-making strategies when selecting answers. Additionally, the interviews assessed their comfort level in responding to certain questions and their confidence in the accuracy of their answers. By focusing on these aspects, the testing provided valuable insights into how survey questions might be misunderstood or

misinterpreted, even if the extent of such issues across a larger population cannot be determined through this method.

The sample included individuals aged 50 and above, reflecting a range of demographic characteristics. Of the 15 participants, there was a near-even split in age groups, with five participants aged 50-59, four aged 60-69, and six aged 70 or older. In terms of gender representation, the group included five males, nine females, and one individual identifying as other. This diverse sample ensured that the interviews captured a variety of perspectives and experiences, offering a broad foundation for identifying potential issues with the survey questions.

Overall, the cognitive testing interviews provided a detailed and nuanced understanding of how older adults engaged with survey content, offering essential feedback for refining surveys to ensure clarity and accessibility for this demographic.

The questionnaire and cognitive test

The ClimateMind50+ questionnaire is depicted in Figure 1. The short introduction to the module sets the context for the subsequent questions by briefly explaining the concept of climate change as long-term changes in temperatures and weather patterns, primarily caused by human activities such as burning fossil fuels. This introduction provides a simple and accessible explanation to ensure all respondents, regardless of their prior knowledge, understand the scope of the topic being addressed. The cognitive testing revealed that the introduction was well understood, generally aligning with what people were thinking of when considering climate change.

Question 1 of the survey focuses on how participants would rate their knowledge of climate change and is designed to evaluate their self-perceived understanding of the topic. This question helps identify the level of confidence respondents have in their

knowledge, which is essential for tailoring educational interventions and communication strategies to address any gaps or misconceptions. The cognitive testing revealed that this question was well understood, and no changes were needed.

Question 2 assesses participants' levels of worry about the impact of climate change for them personally, their family and friends, and future generations. It aims to capture the recognition of its potential risks and consequences on themselves and their social circles. Question 3 then seeks to assess perceptions of risk and concern regarding specific climate-related events that may directly impact participants' lives and local environments. The question asks participants how worried they are about the occurrence of various extreme weather events where they currently live, including extended droughts, severe flooding, extreme heat, storms with strong winds, hail or snow, wildfires (and related smoke or pollution), and prolonged or extremely cold winters. Questions 2 and 3 were assessed on a 4 response categories during the cognitive testing with responses as 1. Very worried, 2. Somewhat worried, 3. Not very worried and 4. Not worried at all. There were a number of mentions that “Somewhat worried” and “Not very worried” were similar, we therefore removed the option “Not very worried” and kept the questions with 3 response categories instead. Furthermore, the wording of question 3 was changed from “How worried are you that any of the following extreme weather events might happen where you live right now?” to the current format as some respondents appeared to be thinking about these extreme events more generally as opposed to where they live now.

Question 4 asks participants to consider their preparedness for extreme weather events by selecting applicable statements regarding their reliance on support systems, the safety of their home, and their level of personal preparation. The options include relying on help from family, friends, neighbours, or the local council; confidence in the safety

and comfort of their home; acknowledging a lack of preparation; or feeling that no preparation is necessary. This question helps to assess participants' perceived readiness for extreme weather events and highlights any potential gaps in resources, awareness, or support networks that could impact their resilience. Following cognitive testing, the response option "I can use nearby public spaces" was rephrased to "I can rely on the help of the local council", as respondents found the former to be unclear. In countries where local councils do not exist, this response can be adapted to use contextually relevant wording to ensure clarity and applicability.

Question 5 is designed to assess respondents' environmentally sustainable lifestyle practices and the changes they have made due to their concern for the environment. It consists of a list of specific actions that individuals may have taken to reduce their environmental impact, with a simple "Yes" or "No" response for each item. Respondents are also provided an open-ended section to describe other environmentally sustainable actions they may have taken, allowing for a broader understanding of individual contributions to environmental sustainability. This question helps capture both specific and diverse behaviours linked to environmental concern. This question required the most substantial revisions following cognitive testing to enhance its clarity and usability. Initially, the response categories measured the frequency of actions taken, but this was simplified to a straightforward "Yes" or "No" format, as the frequency scale was found to be overly complex and potentially confusing for respondents. The examples provided for each action were also significantly reduced, as the initial list was judged to be excessive and overwhelming, detracting from the question's focus. Furthermore, the timeframe for considering these actions was adjusted from "in the past two years" to "ever," as respondents indicated that a longer timeframe was more appropriate for capturing meaningful changes in behaviour, particularly among older populations.

These changes collectively aimed to streamline the question and ensuring it effectively captured the intended data.

Question 6 aims to explore respondents' engagement in various climate-related actions, reflecting their level of involvement and commitment to addressing environmental issues. Respondents are asked to select all applicable actions from a predefined list. Additionally, respondents can specify other climate-related activities they have undertaken in an open-ended section or indicate that they have not participated in any of the listed actions. During cognitive testing, this question was well understood by respondents; however, as in Question 5, the specified timeframe was dropped and replaced with "ever" to better capture the breadth of climate actions over a longer period of time. Furthermore, it was suggested that responses would be assessed only on a Yes/No scale rather than Always/Whenever possible/Never. Lastly, it was recommended to add a couple of examples about activities undertaken to reduce waste.

Conclusion

The ClimateMind50+ questionnaire is an effective tool for measuring several aspects of climate change that are particularly relevant for individuals aged 50 and above. It enables the collection of critical data to understand the relationship between climate change and healthy aging. Designed to be quick to administer, the questionnaire offers flexibility in its delivery—whether face-to-face, by telephone, or through self-administration online or on paper—thanks to its simplicity and ease of completion. By addressing dimensions such as knowledge, worries, preparedness, behaviours, and engagement, the ClimateMind50+ provides comprehensive insights into the unique

perspectives of older adults, empowering researchers and policymakers to craft informed strategies for mitigating climate risks while promoting sustainable and healthy aging practices.

Funding: Paola Zaninotto is co-Investigator of The English Longitudinal Study of Ageing which is funded by the National Institute on Aging (Ref: R01AG017644) and by a consortium of UK government departments: Department for Health and Social Care; Department for Transport; Department for Work and Pensions, which is coordinated by the National Institute for Health Research (NIHR, Ref: 198-1074).

Acknowledgement: We would like to thank the National Centre for Social Research, and in particular Lina Loyd, for conducting the cognitive testing and providing extensive support in the development of the questionnaire. Their contributions have been invaluable to this project.

Figure 1. ClimateMind50+ questionnaire

ClimateMind50+

The next few questions are about climate change. This is when temperatures and weather change over a long time. It is mainly caused by human activities like burning fossil fuels, causing global warming and other changes in the environment.

1 How would you rate your knowledge of climate change?

EXCELLENT	GOOD	FAIR	POOR
○	○	○	○

2 How worried are you about the impact of climate change for:

	VERY WORRIED	SOMEWHAT WORRIED	NOT AL ALL WORRIED
You personally	○	○	○
Your family and friends	○	○	○
Future generations	○	○	○

3 Thinking about where you live right now, how worried are you that any of the following extreme weather events might happen?

	VERY WORRIED	SOMEWHAT WORRIED	NOT AL ALL WORRIED
Extended dry period without rain	○	○	○
Severe flooding	○	○	○
Extreme heat	○	○	○
Heavy storms with strong winds, rain, hail, snow	○	○	○
Wildfires (including exposure to the smoke and pollution)	○	○	○
Extended or extremely cold winters	○	○	○

4 Thinking of where you live right now, which of the following statements would apply to you if extreme weather events were to happen?
Pick all that apply.

- I can rely on the help of family, friends or neighbours ☐
- I can rely on the help of the local council ☐
- My home will remain comfortable and safe in any extreme events ☐
- I have not prepared myself for any extreme events ☐
- I do not need to be prepared for any extreme events [EXCLUSIVE] ☐
- Other (specify)_____

5 Have you made any of the following changes to your lifestyle because you care about the environment?

	YES	NO
I have adjusted my mode of travelling (biking, walking, public transport, electric vehicle, etc.)	○	○
I use environmentally sustainable products (clothes, cleaning etc.)	○	○
I have adjusted my eating habits (reduced meat consumption, buying locally-produced food, etc.)	○	○
I have reduced waste production (buying less new items, use reusable items, etc.)	○	○
I have reduced my energy use (turned down my heating, used less electricity, etc)	○	○

Please tell us what any other things you do that are environmentally sustainable?

_____

6 Have you ever taken any of the following climate actions?
Pick all that apply.

- Educated myself about environmental issues ☐
- Educated others about environmental issues ☐
- Taken part in a protest/rally about environmental issues ☐
- Taken part in a boycott/petition about environmental issues ☐
- Organised a protest/rally about environmental issues ☐
- Organised a boycott/petition about environmental issues ☐
- I have not prepared myself for any extreme events ☐
- Donated money to environmental causes ☐
- Other activities (please specify)_____ ☐
- None of the above ☐
