Abstract

Background: Limited recent data exist on prescribing patterns and patient characteristics for glucagon-like peptide 1 receptor agonists (GLP-1 RAs), an important drug class used as anti-diabetic medication (ADM) for patients with type 2 diabetes mellitus (T2D) and/or anti-obesity medication (AOM) in patients with overweight or obesity.

For brevity, we use the term GLP-1 RA to refer to both GLP-1 RA and dual GLP-1 RA/GIP medications.

Objective: To describe recent trends in prescribing and dispensing of GLP-1-based medications in the US.

Methods: Using a subset of real-world electronic health record (EHR) data from Truveta, a growing collective of health systems that provide more than 18% of all daily clinical care in the US, we identified people who were prescribed a GLP-1-based medication between January 01, 2018 and December 31, 2024. We describe prescribing volumes and patient characteristics over time, by medication, and by FDA-labeled use. Among the subset of patients for whom post-prescription dispensing data is available, we describe the proportion and characteristics of patients who were and were not dispensed a GLP-1 RA following their prescription.

Results: 1,828,203 patients were prescribed a GLP-1 RA between January 2018 and December 2024, with 8,412,584 total prescriptions during this period. Across the full study period, among first-time prescriptions for which use could be established, ADMs accounted for 77.2% and AOMs accounted for 22.8%. The most common first-time medication was semaglutide (n = 1,016,220). During December 2024, overall AOM prescribing was highest for tirzepatide (+21.95%). Among those with available data, 67.3% of first-time ADM prescriptions overall and 69.0% in September 2024 had a fill within 60 days. By comparison, 43.6% of first-time AOM prescriptions overall and 48.7% in September 2024 had a fill within 60 days.

Trends in Prescribing

	GLP-1 RA	Semaglutide	Tirzepatide	Liraglutide	Dulaglutide	Other
Overall						
September 2024	5.14%	2.85%	1.85%	0.07%	0.44%	0.03%
December 2024	5.24%	2.71%	2.10%	0.07%	0.42%	0.03%
Change (percentage)	+1.89%	-4.83%	+13.48%	-6.21%	-3.88%	-7.86%
Difference (percentage points)	+0.10%	-0.14%	+0.25%	-0.00%	-0.02%	-0.00%
ADM						
September 2024	2.83%	1.39%	0.99%	0.01%	0.44%	0.03%
December 2024	2.81%	1.34%	1.04%	0.01%	0.42%	0.03%
Change (percentage)	-0.88%	-3.92%	+4.49%	-14.40%	-3.88%	-7.86%
Difference (percentage points)	-0.02%	-0.05%	+0.04%	-0.00%	-0.02%	-0.00%
AOM						
September 2024	1.36%	0.75%	0.61%	0.02%	n/a	n/a
December 2024	1.46%	0.71%	0.75%	0.02%	n/a	n/a
Change (percentage)	+6.98%	-4.87%	+21.95%	-9.67%		
Difference (percentage points)	+0.10%	-0.04%	+0.13%	-0.00%		
Unknown						

	GLP-1 RA	Semaglutide	Tirzepatide	Liraglutide	Dulaglutide	Other
September 2024	1.19%	0.81%	0.34%	0.05%	n/a	n/a
December 2024	1.23%	0.75%	0.44%	0.04%	n/a	n/a
Change (percentage)	+2.89%	-7.17%	+27.58%	-3.69%		
Difference (percentage points)	+0.03%	-0.06%	+0.09%	-0.00%		

- Overall prescribing rates (GLP-1 RA prescriptions per total prescriptions) in December 2024 were similar to September 2024 (+1.89%).
- ADM prescribing rates in December 2024 were similar to those in September 2024 (-0.88%).
- Among ADMs, semaglutide continues to be the most prescribed medication (1.34% of all prescriptions), however prescription rates decreased (-3.92%)
- AOM prescribing increased slightly in December 2024 compared to September 2024 (+6.98%).
- Amongst AOMs, tirzepatide was the most prescribed medication (a rate increase of 21.95%).

Trends in First-Time Prescribing

	GLP-1 RA	Semaglutide	Tirzepatide	Liraglutide	Dulaglutide	Other
Overall						
September 2024	1.23%	0.74%	0.40%	0.01%	0.07%	0.01%
December 2024	1.10%	0.62%	0.41%	0.01%	0.05%	0.01%

Change (percentage)	-5.63%	-5.97%	-4.61%	+8.52%		
Difference (percentage points)	-2.45%	-2.63%	-1.86%	+4.46%		

- During the full time period (2018 – 2024), 69.4% of GLP-1 RA prescriptions had a dispense within 60 days of their prescription (e.g., were initiated within 60 days).
- For patients first prescribed an ADM in September 2024, 68.99% filled a GLP-1 RA within 60 days. Initiation rates for ADM GLP-1 RA in September 2024 were similar to June 2024 (+1.08%).
- For patients first prescribed an AOM in September 2024, 48.69% filled a GLP-1 RA within 60 days. Initiation rates for AOM GLP-1 RA in September 2024 were similar to June 2024 (+1.16%).

About this report

This report provides recent trends in the prescribing and dispensing of glucagon-like peptide-1 receptor agonist (GLP-1 RAs)-based medications, including dual GLP-1 RA/gastric inhibitory polypeptide (GIP) over time, by medication, and by FDA-labeled use. We used near real-time, aggregated electronic health record (EHR) data from a collective of US healthcare systems to describe prescribing and dispensing of GLP-1 RA medications from January 2018 to December 2024.

Introduction

Obesity and type 2 diabetes mellitus (T2D) are interconnected epidemics with a high prevalence and individual and combined negative impacts on health (CDC, 2020, Hales, 2020). Glucagon-like peptide-1 receptor agonist (GLP-1 RAs) -based medications, including dual GLP-1 RA/gastric inhibitory polypeptide (GIP), have been shown to improve glycemic control in patients with T2D and reduce weight in patients with and without T2D (Davies, 2015, Davies, 2021, Garvey, 2023, Jastreboff, 2022, Wilding, 2023, Yeh, 2023). GLP-1 RA have also demonstrated cardiovascular benefit in patients with and without T2D (Lincoff, 2023, Ussher, 2023).

Interest in these medications has recently accelerated, largely for their weight-loss effects; however, limited empiric data exist on prescribing, dispensing, and patient characteristics. Access to and use of GLP-1 RA may be impacted by high cost, limited insurance coverage for patients without T2D and medication shortages.

Methods

Data

We evaluated prescribing and dispensing of GLP-1 RAs between January 2018 and December 2024 using a subset of Truveta Data. Truveta provides access to continuously updated, linked, and de-identified electronic health record (EHR) from a collective of US health care systems that provide 18% of all daily clinical care in the US, including structured information on demographics, encounters, diagnoses, vital signs (e.g., weight, BMI, blood pressure), medication requests (prescriptions), medication administration, laboratory and diagnostic tests and results (e.g., HbA1c tests and values), and procedures. Updated EHR data are provided daily to Truveta by member health care systems. In addition to EHR data for care delivered within Truveta member health care systems, medication dispensing and social drivers of health (SDOH)

information are made available through linked third-party data. Medication dispense (via e-prescribing data) includes fills for prescriptions written both within and outside Truveta member health care systems, providing greater observability into patients' medication history. Medication dispense histories are updated at the time of the encounter and include fill dates, NDC or RxNorm codes, quantity dispensed, and days of medication supplied.

Population

We identified GLP-1 RA prescriptions (medication requests) and dispenses among adults using RxNorm and NDC codes for dulaglutide, exenatide, liraglutide, lixisenatide, semaglutide, and tirzepatide. Exenatide and lixisenatide were grouped as 'other' given small relative sizes. Brands were identified when possible using RxNorm and NDC codes. Brands labeled for treatment of T2D were classified as ADMs and brands labeled for treatment of overweight and obesity were classified as AOMs. When brand could not be established, the labeled use was classified as unknown.

Prescribing Analysis

Characteristics of patients ever prescribed a GLP-1 RA were summarized, including demographics, social drivers of health (SDOH), and presence of T2D and/or overweight or obesity. Characteristics are provided by medication and by year of first prescription.

Overall and first-time prescribing rates of GLP-1 RA were summarized over time by medication and labeled use. The prescribing rate was calculated monthly as the number of patients with a GLP-1 RA prescription divided by the number of patients with any prescription in the month. Absolute differences and percentage changes in the rate of GLP-1 RA prescribing over the most recent 3-month period were summarized overall and by medication and labeled use.

Dispensing Analysis

We describe the proportion of GLP-1 RA prescriptions (overall and first-time) with a dispense occurring within 60 days. Dispensing analyses were restricted to prescriptions for which complete 60-day dispensing outcomes could be observed. Dispensing outcomes were considered observable if (1) a dispense was recorded in the 60 days following the prescription, and/or (2) an encounter took place after the 60-day period ended (at which time any dispenses would be observed). To allow sufficient follow-up, we report dispensing with a 90-day delay. Given shortages and expected substitutions at the pharmacy, we considered the dispense of any GLP-1 RA , which could differ from the prescribed GLP-1 RA.

We plot the proportion of prescriptions (overall and first-time) dispensed within 60 days over time, by medication and use. Differences in dispensing were expected between ADMs and AOMs given ADMs are typically covered by insurance, whereas insurance coverage for AOMs is limited. As such, we provide dispensing rates stratified by FDA labeled use. Further, we stratify dispensing by age 65+ vs. 18-64 as a proxy for Medicare coverage. Medicare never provides coverage for AOMs, whereas commercial insurers may.

Results

Overall population

The demographics of patients by first-prescribed medication are as follows:

Table 1: Patient Characteristics by First-Prescribed GLP-1 RA Medication.

	Semaglutide	Tirzepatide	Liraglutide	Dulaglutide	Other	Overall
N	1,016,220 (100.00%)	274,748 (100.00%)	156,470 (100.00%)	305,865 (100.00%)	41,416 (100.00%)	1,794,719 (100.00%)

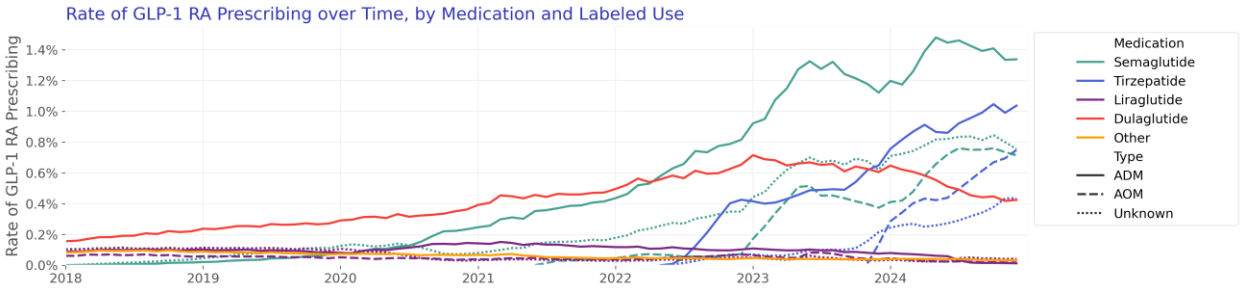
Prescribing over time

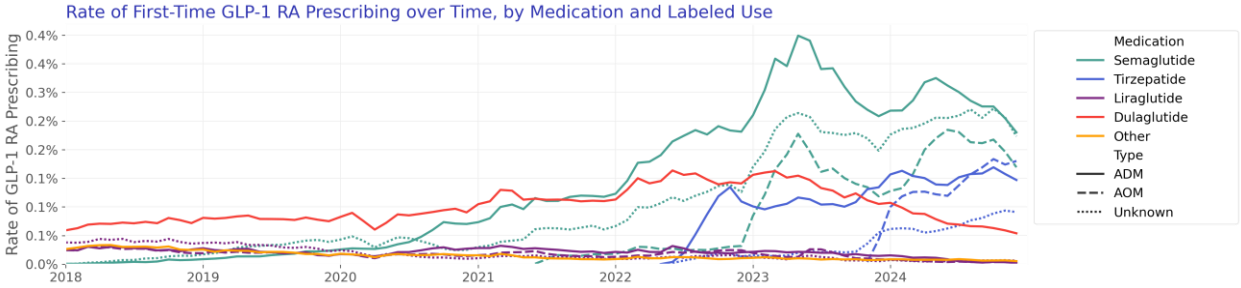
Overall

We describe the monthly rate of prescriptions by medication and FDA labeled use over time:



First-time

We describe the monthly rate of first-time prescriptions by medication and FDA labeled use over time.



Characteristics of patients by year of first GLP-1 RA use are as follows:

Table 2: Patient Characteristics by Year of First GLP-1 RA Prescription.

	2018	2019	2020	2021	2022	2023	2024
N	64,989 (100.00%)	82,046 (100.00%)	89,267 (100.00%)	146,745 (100.00%)	286,101 (100.00%)	527,686 (100.00%)	597,885 (100.00%)

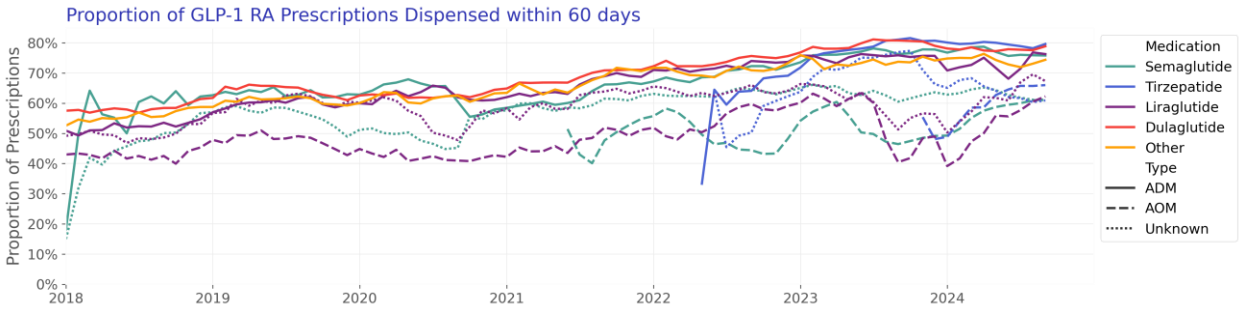
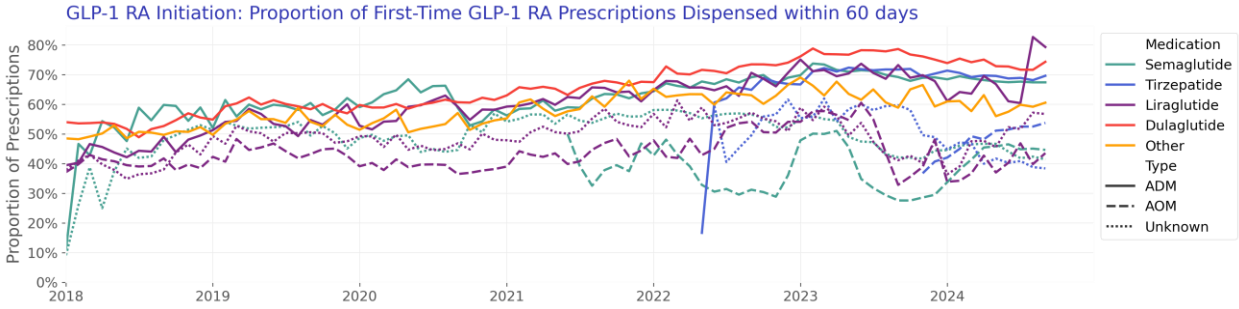
60-day dispensing over time

We describe the proportion of patients with any GLP-1 RA prescriptions (first-time and repeat) in a given month who filled any GLP-1 RA in the 60 days following their prescription.



60-day initiation over time

We describe the proportion of patients first-prescribed a GLP-1 RA who filled any GLP-1 RA in the subsequent 60 days over time.



Patient characteristics are given in Table 3:

Table 3: Patient Characteristics by Dispense Status. Dispense status refers to presence of any GLP-1 RA dispense within 60 days of first GLP-1 RA prescription. Table contains the subset of patients with observable 60-day dispense outcomes.

Discussion and Conclusion

This analysis summarized GLP-1 RA prescribing trends and patient characteristics from January 2018 to December 2024. During this period 1,828,203 patients were prescribed a total of 8,412,584 total prescriptions. ADMs accounted for 81.0% of prescriptions, and AOMs accounted for 19.0%, among prescriptions where use was known. A larger proportion of ADMs, compared to AOMs, were dispensed within 60 days: 67.3% of first-time ADM prescriptions and 43.6% of first-time AOM prescriptions had a fill within 60 days.

Several limitations of our analysis should be noted. All data are preliminary and may change as additional data are obtained. These findings are consistent with data accessed March 03, 2025. Data presented in this analysis represent raw counts and/or rates, and post-stratification methods have not been conducted. In addition, cohorts with small counts may be suppressed during the de-identification process leading to the appearance of zero patients for a given time period. Given relatively large numbers of patients prescribed and dispensed GLP-1 RA, we do not expect substantial suppression in the most recent periods. The unknowns in this report either indicate the value was not included in the individual's electronic health record or that it was excluded from the data to protect an individual's identity as a part of Truveta's commitment to privacy (Truveta, 2024). Finally, this report is a description of prescribing trends and patient characteristics only. Results should not be interpreted as causal.
