Abstract

Background: All fifty U.S. states and the District of Columbia implemented social distancing measures that interrupted transmission of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and reduced morbidity and mortality from coronavirus disease 2019 (COVID-19). All 51 jurisdictions have since begun to relax these measures, albeit in an uncoordinated fashion.

Methods: We obtained state-level data on implementation and relaxation of social distancing measures. We fitted mixed-effects linear regression models with a random effect for state, specifying the time-varying, state-specific effective reproduction number (Rt, the expected number of secondary infections generated by each index case given date-specific population susceptibility and risk behavior). Explanatory variables included time in days, implementation period (1-21 days prior to first relaxation of any statewide social distancing measure vs. time from relaxation through May 28, 2020), and a time-by-period product term.

Results: During the three weeks prior to relaxation, the estimated Rt was declining by an average of 0.0016 units per day (95% confidence interval [CI], -0.0025 to -0.0008). At the time of initial relaxation, states had reported a median 7,628 cases (range, 337-361,313) and 289 COVID-attributable deaths (range, 7-28,663), and the median estimated Rt was 1.0 (range, 0.8-1.3) (i.e., the median rate of epidemic growth across states was estimated to be zero). After the first relaxation of statewide social distancing measures, the estimated Rt began increasing by an average of 0.0047 units per day (95% CI, 0.0037 to 0.0058) compared with the pre-relaxation

period. If these trends continue, the estimated state-level Rt would reach an average value of 1.05 (95% CI, 1.03-1.07) by 30 days after relaxation and 1.15 (95% CI, 1.11-1.18) by 60 days. A similar upward trajectory in the estimated Rt was observed after relaxation of statewide restrictions on internal movement.

Conclusions: Relaxation of U.S. statewide social distancing measures was associated with a subsequent reversal of an earlier downward trend in transmission of SARS-CoV-2, particularly in states with less active epidemics at the time of relaxation.

Introduction

All fifty U.S. states and the District of Columbia implemented social distancing measures that interrupted transmission of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and reduced morbidity and mortality from coronavirus disease 2019 (COVID-19) (1, 2). All 51 jurisdictions have since begun to relax these measures, albeit in an uncoordinated fashion. Using state-level data, we undertook a longitudinal pretest-posttest comparison group study to determine the extent to which relaxation of social distancing measures in the U.S. has led to a recrudescence in transmission.

Methods

We obtained state-level data on implementation and relaxation of social distancing measures, as described previously (2) (**Supplementary Appendix**). We fitted mixed-effects linear regression models with a random effect for state, specifying the time-varying, state-specific effective reproduction number (R_t, the expected number of secondary infections generated by each index case given date-specific population susceptibility and risk behavior, provided by Abbott et al. (3)) as the dependent variable. Explanatory variables included time in days, implementation period (1-21 days prior to first relaxation of any statewide social distancing measure vs. time from relaxation through May 28, 2020), and a time-by-period product term. In sensitivity analyses, we used an alternate model of R_t estimation (4), and fitted stratified models by number of deaths and R_t at the time of relaxation. As a secondary exposure, we examined relaxations of statewide restrictions on internal movement ("lockdowns").

Results

Between April 20 and June 1, 2020, all 51 jurisdictions had relaxed at least one statewide social distancing measure. The **Figure** displays a scatterplot of the estimated R_t for each state by day, along with a smoothed line derived from locally weighted scatterplot smoothing. During the three weeks prior to relaxation, the estimated R_t was declining by an average of 0.0016 units per day (95% confidence interval [CI], -0.0025 to -0.0008) (see **Table**). At the time of initial relaxation, states had reported a median 7,628 cases (range, 337-361,313) and 289 COVID-attributable deaths (range, 7-28,663), and the median estimated R_t was 1.0 (range, 0.8-1.3) (i.e., the median rate of epidemic growth across states was estimated to be zero). After the first relaxation of statewide social distancing measures, the estimated R_t began increasing by an average of 0.0047 units per day (95% CI, 0.0037 to 0.0058) compared with the pre-relaxation period. If these trends continue, the estimated state-level R_t would reach an average value of 1.05 (95% CI, 1.03-1.07) by 30 days after relaxation and 1.15 (95% CI, 1.11-1.18) by 60 days. A similar upward trajectory in the estimated R_t was observed after relaxation of statewide restrictions on internal movement. The estimated R_t increased faster after relaxation in states with a lower estimated R_t at the time of relaxation. Similar trajectories were obtained with alternative estimates of R_t (4).

Discussion

Relaxation of U.S. statewide social distancing measures was associated with a subsequent reversal of an earlier downward trend in transmission of SARS-CoV-2, particularly in states with less active epidemics at the time of relaxation. The primary limitation of our analysis is that simultaneous events that influence epidemic growth or reporting, or public health policy, could also influence the trajectories of R_t. Nonetheless, these data suggest that suppression has failed. Active surveillance programs will be needed so that, should observed trends continue, state and local public health leaders can continuously evaluate the stringency of social distancing measures required to prevent subsequent epidemic surges (5). Considering projected timelines for vaccine development, low levels of population infection, and lack of data on protective immunity, thoughtful public health leadership will be needed to ensure that subsequent peaks of mortality are prevented.

Supplementary Appendix

Tsai AC, Harling G, Reynolds Z, Gilbert RF, Siedner MJ. COVID-19 transmission in the U.S. before vs. after relaxation of social distancing measures.

Appendix Methods. Search strategy to identify statewide social distancing measures being relaxed

Appendix Table. Dates of relaxation of statewide social distancing measures, by type of measure and by state

Appendix Methods

Our strategy to identify all statewide social distancing measures being relaxed involved the triangulation of data from state government and third-party sources, as described previously in Siedner MJ, Harling G, Reynolds Z, Gilbert RF, Venkataramani A, Tsai AC. Social distancing to slow the U.S. COVID-19 epidemic: an interrupted time-series analysis. *medRxiv* Epub 8 Apr 2020. doi:2010.1101/2020.2004.2003.20052373. First, during March 25-June 5, 2020 we searched the web sites for all 50 U.S. state and commonwealth governments and the District of Columbia to identify all statewide social distancing measures that were implemented to address the spread of coronavirus infection (including executive orders, legislation, state of emergency or public health emergency declarations, major disaster declarations, restrictions on travel or internal movement, limitations on mass gatherings, and closures of schools or workplaces) that were subsequently relaxed or rescinded. Our searches included the web sites for the respective state governments, state departments of education, state departments of public health, and any state-sponsored COVID-specific web sites.

To ensure the completeness of our search, we then cross-referenced our findings against several third-party sources:

- Cohn A. These states have partially reopened after coronavirus shutdown. The Hill, April 28, 2020. Available at: https://thehill.com/homenews/state-watch/495012-these-states-have-reopened-after-coronavirus-shutdown. Last accessed June 5, 2020.
- Elassar A. This is where each state is during its phased reopening. CNN, May 27, 2020. Available at: https://www.cnn.com/interactive/2020/us/states-reopen-coronavirus-trnd/. Last accessed June 5, 2020.
- Martineau P. Which states are reopening, which remain on lockdown, and why. *Wired*, May 6, 2020. Available at: https://www.wired.com/story/which-states-reopening-lockdown/. Last accessed June 5, 2020.
- Mervosh S, Lee JC, Gamio L, Popvich N. See how all 50 states are reopening. *New York Times*. Available at: https://www.nytimes.com/interactive/2020/us/states-reopen-map-coronavirus.html. Last accessed June 5, 2020.
- Treisman R. Which states are reopening? A state-by-state guide. NPR, June 4, 2020. Available at: https://www.npr.org/2020/03/12/815200313/what-governors-are-doing-to-tackle-spreading-coronavirus. Last accessed June 5, 2020.

In the event we identified any discrepancies, official state government sources were assumed to have precedence.

Relaxation of social distancing policies were categorized as follows: reopening public schools, including child care facilities and camps; reopening workplaces, including professional offices and curbside retail; reopening the service industry, including barber shops, bowling alleys, cafes, gyms, in-store retail, libraries, pet groomers, museums, restaurants, salons, and zoos; allowing public events, including concerts, conferences, religious assembly, sporting events, and theatres; reopening outdoor recreational facilities, including beaches, campgrounds, golf courses, parks, swimming pools, and team athletics; lifting restrictions on internal movement (i.e., shelter-in-place orders, stay-at-home orders, "lockdowns"); and lifting mandatory quarantines for interstate travel.
