## 20 Abstract

### 21 Background

22 Within-household transmission of COVID-19 is responsible for a significant number of infections.

23 The risk of within-household infection is greatly increased among those from Black Asian and  
24 minority ethnic (BAME) and low income communities. Efforts to protect these communities are  
25 urgently needed. The aim of this study is to explore the acceptability of the availability of  
26 accommodation to support isolation among at risk populations.

### 27 Methods

28 Our study used a mixed methods design structured in two phases. In phase 1, we conducted a survey  
29 study of a sample of volunteers from our existing database of 300 individuals who had provided  
30 consent to be contacted about ongoing research projects into infection control. In phase 2, we  
31 conducted semi-structured interviews with 19 participants from BAME communities and low income  
32 communities recruited through social media.

### 33 Results

34 Participants from the survey and interview phase of the study viewed the provision of accommodation  
35 as important and necessary. Factors influencing likely uptake of accommodation included perceived  
36 1) vulnerability of household 2) exposure to the virus and 3) options for isolation at home. Barriers to  
37 accepting the offer of accommodation included 1) being able to isolate at home 2) wanting to be with  
38 family 3) caring responsibilities 4) concerns about mental wellbeing 5) upheaval of moving when ill  
39 and 6) concerns about infection control. Participants raised a series of issues that should be addressed  
40 before accommodation is offered. These included questions regarding who should use temporary  
41 accommodation and at what stage to effectively reduce transmission in the home, and how infection  
42 control in temporary accommodation would be managed.

### 43 Conclusion

44 This research provides evidence that the provision of accommodation to prevent within household  
45 transmission of the virus is viewed as acceptable, feasible and necessary by many people who are  
46 concerned about infection transmission in the home. We explore ways in which accommodation

47 might be offered. In particular, vulnerable members of the household could be protected if  
48 accommodation is offered to individuals who are informed through test trace and isolate that they  
49 have been in contact with the virus.  
50 Key words: COVID-19; BAME communities; self-isolation; quarantine; infection control;  
51 participatory research

## 52 Introduction

53 Human behaviour is central to the transmission of COVID-19. To reduce transmission in the absence  
54 of pharmaceutical interventions, a series of behavioural interventions have been suggested and  
55 implemented (1). Whilst the introduction of social distancing behaviours can reduce the spread of  
56 COVID-19 within the community (2), people with symptoms of the virus are instructed to remain in  
57 the home; potentially with cohabiting families and friends. This has led to clusters of infection within  
58 households (3), and within household transmission being highlighted as a dominant route of infection  
59 (4, 5). In order to avoid within household transmission of COVID-19, excellent infection control  
60 measures are needed (4). This includes introducing hygiene protocols, appropriate use of personal  
61 protective equipment (e.g., face mask use when necessary), and within household distancing and  
62 segregation – or ‘self-isolation’ - of infected individuals (5-7). Although effective for reducing within  
63 household transmission (2, 8), there is substantial variation in the extent to which the public are able  
64 and willing to adhere to these behavioural solutions (9-11).

65 There is little doubt that COVID-19 is exposing and widening existing inequalities within society.  
66 Data have shown that those from Black, Asian, and minority ethnic (BAME) communities have a  
67 markedly higher risk of infection (12, 13) and worse clinical outcomes, including intensive therapy  
68 unit (ITU) admission and mortality (14, 15). Likewise, those living in the most deprived areas are  
69 more likely to be diagnosed with COVID-19, and have worse outcomes than those living in the least  
70 deprived areas (15). The reasons underpinning the disproportionate impact of the virus on these  
71 populations are multiple and complex, but include increased risk of occupational and geographical  
72 exposure (12, 15-17) paired with reduced opportunities for social distancing and self-isolation (9).  
73 Indeed, a recent survey highlighted that the ability to isolate was lowest among low income  
74 households and those from BAME communities (9). People from these communities were also  
75 considerably less likely to be able to work remotely. Innovative solutions to prevent the spread of the  
76 virus within BAME and low income group households are therefore urgently required.

77 One potential solution to preventing the transmission of the virus within the home is isolation outside  
78 the home. Centralised – as opposed to individual - isolation has been suggested (3) and implemented

79 successfully in locations such as China and Korea (18). In Wuhan, for example, existing public  
80 venues were rapidly converted into what are termed ‘Fangcang shelter hospitals’. Individuals with  
81 symptoms of COVID-19 would isolate within these shelters, away from friends and family. In  
82 addition to providing food and medical care, these locations ensured adherence to self-isolation  
83 guidance, keeping the families and household members of the infected individual safe from infection,  
84 and provided social engagement, reducing psychological distress associated with self-isolation (19).  
85 Indeed, a key difference between Fangcang shelters and makeshift or emergency hospitals is the  
86 social space provided, allowing residents to engage and socialise with others during the isolation  
87 period (19). However, although cost effective and acceptable to residents living in Wuhan, the  
88 substantial differences in culture and living conditions mean that Fangcang style accommodation may  
89 be less likely to be accepted by individuals in many European countries.

90 A small number of European countries have however, converted some hotels, hostels, dormitories or  
91 specialised facilities into special facilities to accommodate people who are experiencing symptoms of  
92 the virus (20). This strategy has not been widely implemented, and most of Europe and the United  
93 States continue to encourage individuals with symptoms to self-isolate within the home. In the United  
94 Kingdom, National Health Service (NHS) workers were offered, on a voluntary basis, the option of  
95 staying in NHS reimbursed hotel accommodation to enable them to continue to work if they were  
96 living with others who may be vulnerable. For those who can afford it, self-funded luxury hotel  
97 “quarantine packages” are available (21-23), but, funded accommodation has not yet been offered in  
98 the UK to individuals or communities outside the NHS, who may be at risk.

99 Whilst the offer of funded accommodation within which to self-isolate or quarantine is a potentially  
100 viable strategy, it is critical that interventions are culturally appropriate and acceptable to the  
101 communities that they serve to protect. This requires extensive input from target users to understand  
102 the environmental and cultural context within which the intervention could be introduced, as well as  
103 the psychological and social factors likely to influence uptake (9).

104 The aim of this research is therefore to understand whether or not offers of accommodation would be  
105 acceptable and feasible for people concerned about reducing infection transmission in the home, and

106 among BAME and low income communities, and to elicit discussions regarding what we can do to  
107 improve advice and approaches to reduce transmission of the virus within the home.

## 108 Methods

### 109 Study design

110 Our study used a mixed methods design structured in two phases. In phase 1, we conducted a survey  
111 study of a sample of volunteers from our existing database of 300 individuals who had been recruited  
112 through their engagement with Germ Defence, a website aiming to reduce infection risks in the home  
113 (Supplement 1). These individuals had provided consent to be contacted about ongoing research  
114 projects. In phase 2, we conducted semi-structured interviews with 19 participants from BAME and  
115 low income communities. These interviews were designed to help us explore further concepts  
116 identified in phase 1, and to elicit discussions regarding how accommodation could best be utilised.

### 117 Phase 1

#### 118 Data collection

119 A convenience sample of volunteers who had previously provided consent to be contacted and invited  
120 to take part in research were recruited via email distribution lists. Participants were invited to  
121 complete a confidential online survey regarding their ability and willingness to isolate within the  
122 home, and the acceptability of accommodation to isolate outside the home. Informed consent was  
123 collected online before starting the survey.

#### 124 Data analysis

125 Frequencies and descriptive statistics are presented for closed survey questions. Free text answers  
126 were used to offer further insight into, and explanations for, answers given to closed survey questions.  
127 We identified barriers and facilitators related to the provision of accommodation with qualitative  
128 content analysis in three stages (24, 25). First, responses to the survey were coded by two authors  
129 independently. During stage two, codes were categorised into a unique list of barriers and facilitators,  
130 which were discussed and refined by the same two authors. Data were then assigned to each category,  
131 and counts of text assigned to each category were generated.

132 Phase 2

133 Data collection

134 Volunteers from BAME and low income communities were recruited via existing contacts with  
135 community groups, social media advertisements, and snowball sampling. Interested individuals  
136 responded to an invitation take part in research to understand experiences and interpretations of self-  
137 isolation and protection during the pandemic. Participants were over the age of 18 years and residing  
138 in the UK. We purposely sampled for diversity in key factors, including ethnicity, living  
139 arrangements, occupation, and vulnerability. Sample size was informed by the concept of  
140 ‘information power’, (26) with analysis and sampling conducted in parallel and continuous  
141 assessment of the suitability of the information within the sample with regard to study objectives.  
142 Potential participants contacting the research team were provided with a study information sheet and  
143 given an opportunity to ask any questions. Participants were informed of the voluntary nature of  
144 participation in the study, and assured of the confidentiality of the data collected. As all interviews  
145 were conducted via the telephone or online, audio recorded (rather than written) verbal consent was  
146 obtained.

147 The semi-structured topic guide (Supplement 2) was informed by data collected during phase 1 as  
148 well as existing literature, and conversations with experts in public health, behaviour change and  
149 intervention development. Questions were designed to explore participants’ current living situation,  
150 their experiences of isolation within the home, perceptions relating to the provision of accommodation  
151 to reduce transmission in the home, and suggestions regarding how accommodation may be used and  
152 facilitated. Interviews lasted between 21 and 55 minutes (mean duration 38 minutes).

153 Analysis

154 Data from the interviews were analysed using a thematic approach aimed at identifying issues raised  
155 by the participants and ways in which these issues may be mitigated (27). Following the stages of  
156 thematic analysis, two researchers independently read transcripts to assign codes to the data and  
157 identify possible themes. These themes were discussed and refined through discussion. An initial  
158 framework was developed, checked against the data, and refined as necessary. Charts were developed

159 for each theme in the framework, and relevant text from the transcripts were be copied or summarised  
160 under each theme in the chart. Charts were then used to compare data within and between individuals.  
161 Participants were invited to discuss the analysis and interpretations with the researchers via skype or  
162 email.

## 163 Results

### 164 Phase 1

165 A total of 110 respondents completed the survey (Table 1). Of all respondents, 24 (22%) stated that  
166 they would accept an offer of accommodation if it was available, 25 (22%) said that they would  
167 probably accept, 21 (19%) said they would probably not accept and 39 (35%) said that they would not  
168 accept. Of the 85 (77%) participants who said they were not able to isolate at home, 24 (28%) said  
169 they would accept, 23 (27%) said that they would probably accept, 18 (21%) said that they would  
170 probably not accept, and 16 (18%) said they would not accept. Of those unable to isolate at home, and  
171 who also considered themselves to be of high risk if they catch the virus (N = 36) or living with  
172 someone who is high risk (N 18), a total of 19 (35%) said that they would accept, 12 (22%) would  
173 probably accept, 14 (26%) would probably not accept, and 8 (14%) would not accept.

174 Three factors were coded as facilitators influencing decisions to accept an offer of accommodation to  
175 reduce transmission in the home (Table 2). These were to protect others within the household, to  
176 control the virus, and to avoid using shared spaces. Seven barriers to accepting the offer of  
177 accommodation included 1) the ability to isolate within the home, 2) not wanting to be apart from  
178 family 3) having caring responsibilities (4) concerns about the impact of isolation on mental  
179 wellbeing and relationships (5) concerns about the upheaval of moving when ill, (6) perceived risk of  
180 catching or spreading coronavirus if leaving the building, and (7) unfeasible for unspecified reasons  
181 (Table 2).

### 182 Phase 2

183 A total of 19 participants took part in the interviews from Black African (N=2), Black British (N=1),  
184 Mixed White / Black Caribbean (N=1) Indian (N=5), British Indian (N=2) Asian (N=1) British Asian  
185 Pakistani (N=1) and White (N=6) ethnic groups (Table 1). Only two participants reported that they

186 would be unlikely to accept the offer of accommodation outside the home. Six participants said that  
187 they would accept as a last resort, four said that they would have accepted the offer had it been  
188 needed, and six participants said that they would be likely to accept. One participant had moved a  
189 family member out of the home for 11 weeks during the pandemic.

#### 190 Protecting the household

191 Participants were positive about the idea of accommodation being offered to reduce transmission of  
192 the virus in the home. It was considered to be a highly effective way of preventing the spread of the  
193 virus among those who were unable to isolate within their current homes.

194 *“If I was offered accommodation which meant that my family were kept safe, then absolutely I would,  
195 I would welcome it” (Participant 14, White, female).*

196 Critically, participants thought that it had the potential to save lives:

197 *“Wow that would probably have saved a lot of lives actually. Yeah” (Participant 03, British Asian  
198 Pakistani, male).*

#### 199 Risk

200 The decision to accept, or not, the offer of accommodation appeared to be influenced by how at risk  
201 the person considered themselves or their household to be. Perceived risk was influenced by how  
202 vulnerable the participant (or their household) were perceived to be, level of exposure to the virus,  
203 and level of contact with household members.

#### 204 Vulnerability

205 Eight participants considered themselves or a member of their household to be vulnerable, and this  
206 was strongly influential in decisions regarding the use of temporary accommodation. One participant,  
207 whose husband had moved out of family home for 11 weeks over the pandemic, explained how  
208 keeping her vulnerable daughter safe was their main priority:

209 *“It’s just something that has to be done, you know, and he actually didn’t come back inside the house,  
210 he left for work that morning and then didn’t come back for 11 weeks. His bags were packed, his bags  
211 were packed and the hotel was booked by the evening and gone” (Participant 18, White, female).*

212 Participants who did not consider themselves (or their household) to be vulnerable reported that they  
213 would be more willing to accept the offer of accommodation outside the home if they or their family  
214 were vulnerable:

215 *“Yeah maybe if I had my older relatives with me, or I had somebody who um, you know had any*  
216 *underlying health condition, probably yeah I would have offered to go out, but in the current situation*  
217 *I wouldn’t have, so. If I had somebody who was living with me who was over 65 years old or who had*  
218 *heart disease or was diabetic, I would offered to go out yes of the house” (Participant 06, Indian,*  
219 *female).*

220 Due to the severity of the virus, any one could consider themselves to be vulnerable, regardless of age  
221 and health status:

222 *“I even read on the net or so, I’m not sure if this information is credible or not, but still what I saw on*  
223 *the net is even if you get the virus even if you recover from it, it can have detrimental consequences on*  
224 *your health. For example I read somewhere on the net I read that if you have the virus it can damage*  
225 *your lungs, like, forever, it can have impact on your lungs forever, so this bit of information is quite*  
226 *scary” (Participant 07, Indian, female).*

## 227 Exposure to the virus

228 Accommodation was considered to be particularly important for those who are in situations in which  
229 there is potential for high exposure to the virus. There was wide understanding that those from BAME  
230 and low income communities were more likely to be in situations in which exposure to the virus is  
231 probable:

232 *“Lots of people of colour, and not just, Bangladeshi etcetera, who work in jobs where they have no*  
233 *choice but to go in. You know, if someone said isolate, they would say ‘well how will I feed my*  
234 *family?’ They have to go in. So they’re in jobs where they have to go in, they have to mix with the*  
235 *public” (Participant 11, Black African, female).*

236 Participants even described situations in which people from BAME communities were asked to leave  
237 accommodation due to increased exposure to the virus:

238 “When he got back [from work] the door locks were changed and she [the landlady] said ‘I’m really  
239 sorry but I can’t have you in here because I’m too frightened, you’re a cab driver, you’re seeing all  
240 these people you’re going to infect the whole house you know, I’m sorry I can’t have you in here’”  
241 (Participant 11, Black African, female).

242 Whilst recognising the value of accommodation, those who were not exposed to the virus thought that  
243 accommodation would be unnecessary for their household:

244 “If I’m not taking the precaution for example, if I have to go to work, then yeah I would suggest for  
245 him to isolate somewhere else because I might have the virus in transfer it to him, so yeah. But my  
246 case is different because I work from home and I’m not going out and I’m not meeting people, so  
247 yeah. There would be no point for him to self-isolate somewhere else when I’m not going out”  
248 (Participant 07, Indian, female).

#### 249 Contact with household members

250 Accommodation was viewed as being important for those who are unable to isolate from their  
251 household due to the size of the house and / or the size of the household. Participants described how  
252 they would be willing to move out of the home as the amount of shared space would make isolation  
253 within the home difficult:

254 “Well personally, I wouldn’t have been any choice, I think it’s the best way to prevent either him or  
255 me from getting the virus because living in the same house, it would be, uh the risk would be very high  
256 because we are sharing the same bathroom, the same kitchen, uh you know, so it would be very  
257 difficult” (Participant 07, Indian, female).

258 Among BAME communities in particular, this was considered to be a substantial problem as many  
259 within the community would live in multigenerational households:

260 “That idea was a very good idea. I mean in [home town] there are areas where you have three  
261 generations living in a terraced house, grandparents, parents and the children yeah. Okay yeah now  
262 the reason why there is such a high rate of the virus here in [home town] is because of the housing  
263 here. Yeah outdated housing, and you know, because the family unit is very good, they look after each  
264 other, but because of COVID it’s come back to haunt us big time” (Participant 12, Asian, male).

265 However, even those who had sufficient space for isolation highlighted difficulties in containing the  
266 virus and preventing the spread of viruses within the household:

267 *“I think personally that’s a really really good idea. Because going back to what I was saying about*  
268 *infection control I know how hard it must be to limit exposure if one of you’s got a virus, not just*  
269 *COVID, but any virus” (Participant 14, White, female).*

## 270 Key concerns

271 Participants raised a series of issues and concerns surrounding the provision of accommodation  
272 outside the home that should be addressed before such a scheme could be offered. Participants were  
273 keen to understand who should use temporary accommodation, at what stage, and for how long.  
274 Concerns were also raised among those with caring duties and responsibilities, and questions were  
275 asked regarding who would fund the scheme.

## 276 Timing and duration

277 Participants wanted clarification regarding the stage at which people should move into temporary  
278 accommodation, and for how long. Participants were concerned that it would be too late to move out  
279 of the home once symptoms had presented.

280 *“It’s, the, to me, because all the guidance and information that we’ve had is that you’re contagious*  
281 *before you start showing symptoms, I wouldn’t want to, because in my opinion if that is all true, you*  
282 *would already been exposed to it, he’d have already had it or already have it, um it just it feels like*  
283 *that would be too late” (Participant 15, White, female).*

284 Despite concerns about leaving it too late, participants were not willing to move out of the home for  
285 long and unspecified periods of time:

286 *“I will be very very reluctant to go and live somewhere else. If it’s for about a week or something I*  
287 *don’t mind, but uh, but still yes it’s just a matter of change because we have always lived in our*  
288 *houses, so to go out and live somewhere else it’s quite a bit of a change” (Participant 13, Indian,*  
289 *male).*

290 In the case of the extremely clinically vulnerable, the duration was deemed necessary to protect the  
291 family:

292 “You’ve just got to get through it, and it was only like, well it could have been 12 weeks, but in a  
293 lifetime it’s not that long, really” (Participant 18, White, female).

294 Who should use temporary accommodation

295 Participants raised questions about whether the intention would be for symptomatic persons or  
296 vulnerable persons to leave the home for temporary accommodation. Concerns were expressed  
297 regarding the potential of infected individuals to spread the virus should they leave the home to stay,  
298 for example, with a family member:

299 “I think I would probably self-isolate too at my own house, rather than, because I might already have  
300 symptoms unknowingly, and then if I go to another household I might spread it to say, like my mum,  
301 so I think I would actually stay put” (Participant 02, Mixed White/ Black Caribbean, female).

302 In addition, concerns were also raised regarding the potential for those who are not infected to catch  
303 the virus in temporary accommodation:

304 “Again I would kind of feel I would be safer at home... You go into somewhere else that I couldn’t  
305 guarantee would be as clean as I would you know, me cleaning it” (Participant 17, White, female).

306 Participants suggested schemes in which exposed workers were asked to move into temporary  
307 accommodation as a preventative measure, thus saving infection from entering the household in the  
308 first place:

309 “I think almost, you’re better offering it to the workers who might go back, so like, a lot of people still  
310 worked throughout, where they couldn’t, so actually, were they the ones taking it back into their own  
311 homes, so actually would it be better targeting the workers and saying right if this happens again, if  
312 you are a key worker and you’ve got people at home, then you go to the hotel, like the NHS staff did,  
313 rather than let’s have it for people who are sick” (Participant 19, White, male).

314 For healthy individuals moving out to protect vulnerable residents, the ability to continue to work was  
315 important, and accommodation with internet access and / or within commuting distance of their work  
316 site would be necessary:

317 “You know, if you were the person who was COVID free and leaving your family in the house, I don’t  
318 know which way round you suggest because if I was COVID free I’d still want to work, so it would  
319 have to be close to work” (Participant 14, White, female).

320 “If it was me going to self-isolate, for example, um, and I work from home you know, I would want,  
321 you know, I would like to be able to still have my internet and be able to carry on with my work”  
322 (Participant 01, Black African, female).

### 323 Caring responsibilities

324 Among those who had caring responsibilities or were dependent on others, concerns were raised as to  
325 who would care for the family in their absence:

326 “Um, it would be hard and difficult because you’re used to living with each other you’re reliant on  
327 each other as a family, you know, I do the shopping for the house most of the time so you know,  
328 cooking and things like that, so if I wasn’t there, or my husband wasn’t there, you know, because of  
329 the kids and all that” (Participant 04, Black British, female).

330 Participants described defined roles and responsibilities for each household member, and removal of  
331 key persons was viewed as problematic:

332 I’m just wondering now what would have happened if she [participant’s wife] had the COVID 19,  
333 because she is the main person who drives the house, because she does the cooking and looks after my  
334 mum, so if she was made to go out and live somewhere else then my mum would have problems, we  
335 would have problems” (Participant 13, Indian, male).

336 Among BAME communities in particular, the need and desire to care for family members was a  
337 considerable cause for concern. Allowing others to care for their relatives was something that was  
338 only to be considered as a last resort:

339 “I wouldn’t like to move out from my house, but if it is really essential then I would move, but I would  
340 try to fight it off (laughs) yeah, and I guess uh, if it happened to my mum then my mum would be the  
341 same, she wouldn’t like to live elsewhere, this was her home for the last 40 years. So because, with  
342 Indians we are very close knitted families, we tend to stick by each other, so to her it would probably

343 *do more damage going away from us than uh, and then uh, yes, than living not here” (Participant 13,*  
344 *Indian, male).*

345 Concerns were raised about having to leave vulnerable members, potentially putting them at increased  
346 risk of exposure to the virus:

347 *“If I worked within the NHS and I was a key worker in that respect then possibly, but I still think just*  
348 *would be very difficult for me to leave the family home because of [son’s name] and again, husband*  
349 *and his medical condition, because he wouldn’t be able to look after my son, our son the way I would*  
350 *like, picking up food and medication and what not, and then he’d have to, if I wasn’t there he’d have*  
351 *to take the lift and sort of opening up more risk to, he’d be more in contact with people too, so I would*  
352 *say no in that respect” (Participant 17, White, female).*

353 However, there was recognition that despite best efforts carers may contract the virus and participants  
354 had started to make tentative plans for how they would cope should this happen:

355 *“But that was constantly at the back of my mind like, I am going to the shops and say if I caught the*  
356 *virus on the handle of a trolley and then I touch my nose or my eyes and I have caught the virus now*  
357 *and will I have to relocate or move to my bothers house and who would care for my mother? And*  
358 *these were all questions at the back of my mind, but I do know my house is a 4 bedroom house and I*  
359 *could have self-isolate in another room and not put my mother to more risk or more harm... I would*  
360 *go into a separate room in the house and then sleep in the bed and then ideally move, um, not have*  
361 *any contact at all with my mother in the house and call my brother and ask him to intervene”*  
362 *(Participant 05, British Indian, male).*

### 363 Social and emotional support

364 Despite recognising the value and need for accommodation outside the home, participants struggled  
365 with the idea of having to leave the family and home:

366 *“If you’re forced to stay at home at least you have all of your belongings, all things that bring you*  
367 *comfort and people around you. But if you’re in a hotel room by yourself with just the TV and yeah, I*  
368 *would be so bored I think. Probably very anxious as well and quite upset. I’m such an over thinker as*  
369 *well so I would just be overthinking everything. But also at the same time if it meant that my partner*

370 *doesn't catch it, then I think that's probably the main thing on my mind, if it's temporarily a solution*  
371 *and hopefully that would stop the spread so I would try to look at the positive side of things, but if it*  
372 *was more than two weeks then yeah I really don't know how I would deal with that" (Participant 02,*  
373 *Mixed White/ Black Caribbean).*

374 It was thought that it would be emotionally challenging to be alone and in unfamiliar surroundings:  
375 *"I think that would be quite scary like having to do, like I mean I can't imagine having to do this*  
376 *entire lockdown period by myself, like, obviously I would have to manage but there would have been a*  
377 *lot of different struggles with that kind of thing and I know people who have done it have been lonely*  
378 *and it would have taken a while to adapt, it would be really difficult" (Participant 10, Asian British,*  
379 *female).*

380 Participants highlighted the need for facilities to enable them to continue to communicate with their  
381 friends and family throughout:

382 *"I have a lot of, all my social stuff is now online, so my theatre group, we rehearse online, we have*  
383 *various support groups and stuff, so for me it would be very important to still be able to have that"*  
384 *(Participant 01, Black African, female).*

385 Essential requirements

386 Whilst all participants reported requiring only the basics, further detail regarding food, washing and  
387 cleaning facilities were needed:

388 *"I think a room with internet, and uh a bathroom and then just an understanding of how the uh meal*  
389 *system will work" (Participant 08, Indian, male).*

390 Food in particular was a key concern:

391 *"Um, to be able to cook my own food, for me food is very important to me, it is to everybody, but not*  
392 *everyone has the kind of attention to what they eat, I don't eat meat, um, so um, you know, I eat fish*  
393 *but I, yeah I like to have my own space to cook my food" (Participant 01, Black African, female).*

394 Indeed, there were reports of food related complaints from other locations within which this system is  
395 widely implemented:

396 “Well in the beginning they [residents in isolation facilities in [country]] were really complaining  
397 about the food that they were getting in the centres... and yeah after one or three weeks, I mean, I  
398 guess maybe they changed the types of food they were getting” (Participant 07, Indian, female).

399 Those who had used accommodation to avoid transmitting the virus to vulnerable members of the  
400 household described how they had had to work hard to ensure food and cooking facilities were  
401 available:

402 “He had local chip shops offering to cook him food, especially in the early days when we didn’t really  
403 know, we hadn’t really found our routine, so like the local fish and chip shop were feeding him, to be  
404 fair the people who run the hotel were feeding him, because they live on site, he had work colleagues  
405 bringing him plates of food, people dropping him food off, and then we kind of found routine,  
406 somebody gave him a microwave, somebody else gave him a fridge, somebody else gave him a  
407 toaster. It was a real community effort. Yeah after about 3 or 4 weeks he fell into a routine and he  
408 could cook himself stuff so it wasn’t so bad” (Participant 18, White, female).

409 Those in temporary accommodation could also provide tangible support for vulnerable members of  
410 the family at home:

411 “So for that rocky stage when people were struggling [to secure priority slots], yeah I had a little  
412 servant on the outside” (Participant 18, White, female).

413 Participants also described a need for outside space to maintain physical and emotional health:

414 “I’d need to be able to get outside, to have, like here I have a garden here, so it’s just to be able to,  
415 you know, even when it’s raining I walk out to the garden just to get some air” (Participant 01, Black  
416 African, female)

417 Indeed, outside space for physical activity was considered invaluable to those who had moved out of  
418 the home:

419 “He runs. A lot. An awful lot. So yeah that is how he coped. Yeah, and like initially we thought it was  
420 going to be a lot harder the lockdown, so the first week he thought I’m just going to run when I can  
421 because we thought exercise was going to be stopped. So he kind of hit the 50 mile a week mark, and  
422 then it didn’t stop, so he just kept that up really. Just running every day” (Participant 18, White  
423 female).

## 424 Funding

425 Participants were concerned about costs associated with temporary accommodation. Participants were  
426 unable to cover the costs themselves, and the one participant whose husband had used accommodation  
427 to prevent transmission of the virus to her vulnerable daughter described how it was only possible  
428 because it was free of charge. Although the costs were later covered by the National Health Service  
429 (NHS), she described how it would not have been possible to pay for accommodation without the  
430 goodwill of the community:

431 *“He was really lucky because I know a lot of NHS workers had to wait to move out because NHS*  
432 *trusts and health boards took a while to get their system working, but one of the local hotels, because*  
433 *we live in quite a small area, one of the local hotels offered free rooms, so he was actually able to*  
434 *move out straight away, on that very first Monday he was out. So, yeah. And the health board did pay*  
435 *in the end, but it was right at the end that they decided they were going to pay for it, but the hotel*  
436 *would have given him free room for like 10 weeks, 10, 11 weeks” (Participant 18, White, female).*

437 Despite the lifesaving potential of the scheme, many were unconvinced that it would be funded by the  
438 current government:

439 *“I mean, in all honesty I would be like incredibly surprised if um that was like, if this current*  
440 *government were offering that to people” (Participant 03, British Asian/ Pakistani).*

441 *“Yeah. So that is a very splendid idea if that was possible, but economically it’s not viable is it? It’s a*  
442 *good option but economically I don’t think this government would go for it anyway. But yeah it’s a*  
443 *very good system that if it was in place. Yeah.” (Participant 12, Asian, male).*

## 444 Discussion

### 445 Summary of findings

446 To our knowledge, this is the first study to have explored issues surrounding the option of  
447 accommodation to prevent transmission of the virus in vulnerable households. This work reveals that  
448 the offer of accommodation to protect vulnerable households is viewed positively by many people  
449 who feel their household is at risk. Data collected from both survey and interview participants  
450 highlighted concerns regarding the spread of the virus within the household, and a need for solutions

451 to prevent this. Interviews provided insight into populations who would be likely to accept and benefit  
452 from the offer; and it was suggested that those who are vulnerable, are likely to be exposed to the  
453 virus, and who are unable to isolate within the home would benefit most. Participants who met one or  
454 more of these criteria appeared very willing to accept the offer of accommodation compared with  
455 those who consider themselves or their household not to be vulnerable, were not employed in public  
456 facing occupations, and/or had capacity to isolate within the home. Crucially, and in line with existing  
457 research (12), those from BAME and low income communities were considered to be more exposed  
458 and less able to isolate than those from high income backgrounds.

459 Participants questioned who should use temporary accommodation and at what stage, with legitimate  
460 concerns being raised regarding the utility of isolating outside the home once symptoms are present.  
461 In locations in which accommodation has successfully been used to support self-isolation outside the  
462 home, it is often the symptomatic persons who are offered accommodation for isolation (19, 20). In  
463 the UK, NHS staff who are living with vulnerable family members have been offered accommodation  
464 to protect the family whilst allowing those not at high risk to continue to work (28). Our study  
465 suggests that both approaches could be feasible and acceptable to high risk audiences, but the offer of  
466 accommodation must be timely, and appropriate infection control measures must be in place.  
467 Different households will have different requirements - there is no 'one size fits all'. However, as  
468 lockdown restrictions are lifted, and test, trace and isolate becomes a key strategy in controlling the  
469 virus, making support available to allow certain individuals to isolate safely could make a potentially  
470 valuable contribution to reducing transmission, morbidity and mortality.

#### 471 **Implications of this study**

472 This study revealed some important issues that would need to be addressed to ensure the acceptability  
473 and feasibility of any offer of accommodation for those who need it. Drawing together findings from  
474 the survey and interviews we consider below some of the options available, key concerns associated  
475 with isolating outside the home, and ways in which these may be mitigated.  
476 In locations in which accommodation is provided, it is the individual with the virus who would isolate  
477 outside the home in order to protect vulnerable household members (20). Participants were concerned

478 that, by the time symptoms were evident, transmission of the virus to other household members would  
479 already have occurred. However, with a test, trace and isolate system firmly in place, it would be  
480 possible for those who have been in contact with virus to be offered accommodation to quarantine  
481 before symptoms emerge. Indeed, individuals who are informed that they have been in contact with  
482 the virus may not be willing to return to their homes to await test results if they are living with  
483 vulnerable relatives. The offer of accommodation for individuals in this situation could be highly  
484 effective.

485 A second option for utilising accommodation to prevent transmission of the virus within the  
486 household involves moving vulnerable people out of the home should household members become  
487 symptomatic. Although this was seen as a viable option, again, there were concerns that it would be  
488 too late to make use of temporary accommodation at the stage at which infected persons are showing  
489 symptoms. There is however, emerging evidence to suggest that viral load is associated with disease  
490 severity (29), and initial viral load is likely to be a contributing factor (30). Interventions aiming to  
491 reduce exposure to the virus in the home have been successful (31, 32). However, it is not easy to  
492 avoid contact with infected individuals, and more needs to be done to support vulnerable people (33).  
493 In particular, vulnerable individuals living in large households may be at risk of exposure to a high  
494 viral load from multiple sources if support is not available. In such situations, offering  
495 accommodation to vulnerable individuals, with appropriate care and support, could substantially  
496 reduce their exposure to the virus.

497 Participants recognised the significant practical and emotional challenges associated with utilising  
498 accommodation to prevent transmission of the virus, and it is critical that those who are in quarantine  
499 or isolating outside (and inside) the home are adequately supported. Both practical (e.g., food) and  
500 emotional support will be required, for example through community support networks, similar to  
501 those that were established at the start of the pandemic. Participants also raised critically important  
502 concerns about exposure to infection in temporary accommodation that must be addressed. Strategies  
503 must be put in place to ensure that those in temporary accommodation are not exposed, or exposing  
504 others, to the virus.

505 There were concerns over who would fund accommodation, and indeed, it would not be cost effective  
506 to provide accommodation for all populations. However, we suggest that offering accommodation in a  
507 targeted way to those who are vulnerable, exposed to the virus, and/or unable to quarantine or isolate  
508 safely within their home would reduce these costs, and could even lead to a potential reduction in  
509 healthcare costs if the number of vulnerable individuals exposed to the virus is reduced.

## 510 Limitations

511 The main limitation associated with this work is the extent to which the views of our sample are  
512 representative of the UK population. Our recruitment for phase one occurred via a mailing list of  
513 individuals who had previously used and provided feedback on a website aiming to reduce infection  
514 within the home. This is therefore likely to be a group of individuals who are highly motivated to  
515 engage in infection control behaviours and their views may not be representative of the wider  
516 population. However, those who took part in the interview phase of the study had not shown any prior  
517 interest in infection control practices. Whilst every effort was made to recruit a diverse sample of  
518 participants for interviews, our primary use of social media to recruit participants may have resulted  
519 in individuals with very relevant voices being excluded. For example, those from non-English  
520 speaking communities, those without internet access, and those without social media would have been  
521 missed. Despite attempts to recruit participants through existing networks with community group  
522 leaders, engagement through these networks was minimal and could not be pursued further due to the  
523 need for timely completion of this initial study.

524 The rapidly changing nature of the pandemic and government advice limits the interpretation of our  
525 findings. As perceptions of risk within and outside the home change, the acceptability of  
526 accommodation to prevent transmission of the virus in the home may also shift. Our findings must be  
527 interpreted with this in mind.

## 528 Conclusions

529 Within-household transmission is likely to be a leading cause of morbidity and mortality as we move  
530 out of lockdown (31) and we present just some of the ways in which accommodation may be viewed  
531 and utilised. We recognise the complexities associated with these options, and acknowledge that

532 different households will require very different provisions. However, we suggest that offering  
533 accommodation to vulnerable households following a potential exposure to the virus, or during the  
534 early stages of an outbreak within the home could be acceptable and feasible.  
535

536 Declarations

537 Ethics approval and consent to participate

538 Ethical approval for Phase 1 was provided by Southampton Research Ethics Committee (56445). All  
539 survey participants consented online to take part in the study.

540 Ethical approval for Phase 2 was provided by the NHS Health Research Authority London – Queen  
541 Square Research Ethics Committee (20/HRA/2549). All interview participants verbally consented to  
542 take part in the study.

543 Consent for publication

544 All participants provided verbal or written consent for data to be included in publications.

545 Availability of data and materials

546 The datasets used and/or analysed during the current study are available from the corresponding  
547 author on reasonable request.

548 Competing interests

Table 2: Facilitators and barriers to the uptake of accommodation for isolation – results of the content analysis of survey text

	Description	Example quote	N
<b>Facilitators</b>			
To protect others in my household/if someone at home was high risk	Includes both actual and hypothetical comments about having someone at high risk at home.	<i>If it was a case of protecting my wife, I would probably leave like a shot if it was to her advantage.</i>	25
To control the virus	Includes broader social sense of doing the right thing.	<i>I would be motivated by the compulsion to save others.</i>	5
To avoid using shared areas	To avoid needing to use shared rooms in the home	<i>I live in a big enough house to keep apart, but only one bathroom, so because of shared shower facility might go elsewhere</i>	1
<b>Barriers</b>			
Can self-isolate where I am	Includes having enough space to self-isolate at home, or living alone	<i>We live in the countryside and we are able to self-isolate</i>	28
Not wanting to be apart from family	Unwilling to be away from family	<i>I doubt if we could manage apart from each other we are so interdependent on each other.</i>	10
Caring for others	Having caring responsibilities at home, including children, spouse, parent or pets. Excludes comments	<i>Someone who is dependant on me. I would not be able to support them in any way if I were somewhere else.</i>	4

	where alternative caring options were considered (see below).		
Concerns about implications of isolation for mental well-being and relationships	Worried about negative impact on mental well-being, including loneliness and boredom, or missing family members	<i>Self-isolating can be lonely without contact with other people but doing it in your own home is more comforting with your own things around you</i>	4
Upheaval of moving when ill/want to be in own home when ill	Preference for being at home when feeling ill	<i>Would be better for others to be removed and leave sick person in familiar surroundings</i>	4
Perceived risk from others in the building	Concerned about risk of catching the virus from others in self-isolation accommodation	<i>Definitely would not accept accommodation situated in a building designated for multi occupancy or in an area with higher numbers of fatalities or cases.</i>	2
Unfeasible for unspecified reasons	Self-isolation elsewhere is perceived as unfeasible but no reason is given as to why	<i>There are no circumstances in which I could feasibly self-isolate away from home.</i>	3
<b>Dependent on:</b>			
Location of accommodation	Location of accommodation, focused on proximity to home to allow the person both to receive and	<i>it would need to be relatively close by so that, should my son need care, I could return home as I would not want him to be on his own</i>	22

	provide care to those still at home.	<i>if he became ill and we have no other support nearby.</i>	
Facilities available/suitability of accommodation	Includes requirements for accommodation e.g. comfort, outside space.	<i>Would depend on the quality of the facility - I would not like it to be Spartan, uncomfortable, with poor Wi-Fi, nowhere near a good hospital</i>	11
Support provided for those left at home	Includes considerations about what support would be provided for children, spouses or parents they care for	<i>It would depend on whether someone else who was not ill would be available to look after my son</i>	9
Medical care available at accommodation	Consideration of medical care available and who could look after them, either due to Covid-19 or due to other health conditions.	<i>I would isolate elsewhere especially if a close watch in a nursing capacity was available for me and other isolation participants</i>	7
Access to Wi-Fi	Needing Wi-Fi for staying in touch with people, or running business	<i>I would want to be able to use my PC, phone and tablet.</i>	6
Hygiene and cleanliness of accommodation	Concerned about germs in the self-isolation accommodation	<i>I am more confident in the cleaning regime I have at my own home than trusting it to someone else. I would not be comfortable living anywhere that I hadn't cleaned myself to my own high standards.</i>	5
Special dietary needs being met/access to food	Unsure about how and what food would be provided	<i>I would also want vegetarian food, or ability to get vegetarian (ideally vegan) food.</i>	4

Taking my pet with me	Wanting to take a pet into self-isolation accommodation	<i>Whether I could take my dog with me</i>	1
How much fun it would be	Considering how much fun it would be	<i>Where it was, what facilities were available, whether I'd be able to get food, and how much fun it would be.</i>	1
Whether I have confirmed Covid-19 or just possible exposure	Considering how necessary it is to self-isolate depending on whether a confirmed diagnosis of the virus has been given.	<i>If I had been given a positive CV19 test result and was being asked to isolate remotely to protect my family, I would do so. I would not, however, go into precautionary remote self-isolation in a setting where CV19 was known to be present in other residents simply on the basis of suspected contact with a CV19 carrier.</i>	1
