Abstract

To broadly explore the extent that COVID-19 has initially impacted medical learners around the world and examine global trends and patterns across geographic regions and levels of training, a cross-sectional survey of medical learners was conducted between March 25-June 14th, 2020, shortly after the World Health Organization declared concurrent COVID-19 a pandemic. 6492 medical learners completed the survey from 140 countries, Students were concerned about the quality of their learning, training progression, and milestone fulfillment. Most trainees felt under-utilized and wanted to be engaged clinically in meaningful ways; however, some trainees felt that contributing to healthcare during a pandemic was beyond the scope of a medical learner. Statistically significant differences were detected between levels of training and geographic regions for satisfaction with organizational responses, the impact of COVID-19 on wellness, and state-trait anxiety. Overall, the initial disruption to medical training has been perceived by learners across all levels and geographic regions to have negatively affected their training and well-being, particularly amongst postgraduate trainees. These results provide initial insights into the areas that warrant future research as well as consideration for current and future policy planning, such as the policies for clinical utilization of medical learners during public health emergencies.

Running Head: The global impact of COVID-19 on learners

Introduction

The coronavirus pandemic (COVID-19) represents the first global interruption to medical education since World War II. This public health emergency has required undergraduate and postgraduate medical training programs around the world to rapidly respond, including re-deploying learners to other clinical spaces or removing them entirely, and moving education online to promote physical distancing (Association of American Medical Colleges 2020; Harvey 2020; Rose 2020). The current COVID-19 pandemic has changed the status quo of medical training as we know it – whether for better or for worse remains unclear and may have profound implications.

Prior localized disruptions to medical training have negatively affected trainees, such as pandemics and climate emergencies. The severe acute respiratory syndrome (SARS) pandemic in 2003 revealed the tension between embracing learning opportunities that a public health emergency offers and protecting the needs and well-being of learners (Rieder et al. 2004; Sherbino & Atzema 2004; Rambaldini et al. 2005). The SARS pandemic adversely affected the mental health of learners and healthcare professionals, and heightened anxiety amongst learners was associated with a perceived negative educational experience (Maunder et al. 2003; Bai et al. 2004; Landis & Bradley 2005; Rambaldini et al. 2005). In 2005, the rapid restructuring of the medical school curriculum in response to Hurricane Katrina resulted in a decline in academic performance (Crawford et al. 2008). Lessons from both SARS and Hurricane Katrina highlighted the importance of support networks and attention to learner wellness, recognizing the additional stressors that these disruptions can place on medical trainees (Landis & Bradley 2005; Rambaldini et al. 2005; DiCarlo et al. 2007; Crawford et al. 2008). These emergencies led to significant and rapid innovation in curriculum structure and content (DiCarlo et al. 2007). While disruptions to medical education can provide an impetus to reconsider ethical and practical implications of training during emergencies, training models may remain stagnant (Landis & Bradley 2005; DiCarlo et al. 2007). Despite a heightened awareness fifteen years ago of the potential implications of interruptions to medical education, many organizations and systems entered the current pandemic relatively unprepared.

Running Head: The global impact of COVID-19 on learners

Medical education's understanding of the impact of global emergencies and disruptions to medical training remains limited to SARS and localized emergencies, yet the current pandemic remains the single most substantial disruption to contemporary medical training with global impact. The extent to which COVID-19 has impacted medical training remains speculative and anecdotal, and the consequences and implications may be profound. The research question for this exploratory study was: How have medical learners been impacted by the COVID-19 pandemic around the world?

Methods

Data Collection

We administered a cross-sectional survey between March 25 and June 14, 2020, shortly after the World Health Organization declared COVID-19 a pandemic. Criterion and snowball sampling techniques were used to collect data from undergraduate (e.g., medical students) and postgraduate (e.g., interns, house staff, resident physicians) medical learners at any medical school around the world. This study explicitly focused on medical learners given that they provide a significant proportion of patient care yet are still considered learners.

Our decision to use a survey was based on the ability of this method to efficiently collect empirical data from a large population (Kelley et al. 2003) The survey instrument was designed to include both quantitative and qualitative questions in order to later compare variables across groups, allow participants to provide insight into how they have been impacted using their own words, and use the qualitative data to potentially expand upon the results of the quantitative data (Appendix A). All participants completed demographic questions followed by questions specific to their level of training. Next, shared questions explored the effect of the pandemic on learner wellbeing and their communications with others. Open-ended questions collected qualitative data surrounding the impacts of the pandemic on training, utilization of residents, and strategies used in response to the pandemic. All questions were developed *de novo*, except the 6-item State-Trait Anxiety Inventory (STAI-6) (Marteau & Bekker 1992). One question exploring the impact of the

Running Head: The global impact of COVID-19 on learners

pandemic on five domains of wellness was informed by a holistic framework for learner wellness (Kassam & Ellaway 2020).

An initial survey underwent pilot testing to refine comprehension and functionality. The final survey was translated to 19 additional languages to increase the inclusion of learners from around the world. The survey was administered online using Qualtrics software by distributing an anonymous, re-usable link over social media and through snowball sampling.

Data Analysis

Quantitative data were imported into SPSS Version 26 (IBM Corp., New York) for analysis. Countries were coded to the geographic regions defined by the World Bank to explore geographic differences (World Bank) Descriptive statistics were calculated for each item. Total scores were computed for scaled questions, with positively worded items reverse coded in the calculation. Independent t-tests were used to compare total scores between medical students and residents, and an Analysis of Variance test was used to compare data across geographic regions using a post-hoc correction to account for multiple comparisons. To examine the psychometric properties of the survey, Cronbach's alpha was computed for scaled items to assess reliability evidence and an exploratory factor analysis was used to examine construct validity.

Qualitative data were back translated to English and analyzed in NVivo Version 12 (QSR International, Melbourne). Three investigators read through the data to identify emerging themes, which were then organized into a coding framework for deductive thematic and content analysis to similarly examine trends between levels and across geographic regions (Miles et al. 2014). Two investigators (KB, MM) independently coded 100 responses to refine the initial coding framework and assess inter-rater agreement. After an additional 400 responses were analyzed and the Kappa statistic continued to suggest acceptable inter-rater agreement, and a decision was made to divide to improve efficiency given the volume of data. Upon completion of the coding for all responses, themes in the coding framework were divided amongst the research team. Each member analyzed the data coded to their assigned themes and summarized the trends and patterns in the data. Theme summaries were compiled for interpretation by the study team, who then compared and contrasted the results of the qualitative data with the quantitative data to

Running Head: The global impact of COVID-19 on learners

examine how these findings converge or diverge from, and ultimately expand upon, the quantitative results.

The University of Calgary Conjoint Health Research Ethics Board reviewed and approved this study (File #20-0484). Participation in this study was voluntary. Implied consent was obtained from all participants. Participants had the option to either skip individual questions or select “prefer not to answer.”

Results

A total of 6492 learners from 140 countries completed the survey. The majority of participants were medical students (81.0%) and from Europe and Central Asia (43.4%) (Table 1). The results for both medical student-specific and resident-specific questions are summarized in Table 2. Figure 1 visualizes the responses to the scaled questions for both levels (see Appendix B for additional visualizations of the data by level of training and geographic region).

[Table 1, Table 2, Figure 1]

Undergraduate Medical Learners

The majority (84.3%) of clinical-level medical students were excused from clinical duties; however, some worked clinically in some capacity (9.0%). Most spent their time in online learning coordinated by their medical school (68.2%), pursuing self-directed learning (44.1%), resting (36.4%), and engaging in more wellness activities than normal (31.4%). Most (80.9%) had online learning coordinated by their school but 66.5% felt their education would be of lower quality as a result. Some had difficulties learning from home (21.0%) and accessing the internet (11.0%).

Students reported that their core electives (23.5%) and visiting electives (19.5%) were cancelled or postponed. The qualitative data highlighted how reduced clinical exposure limited opportunities to explore specialties, decreased career interests, and created anxiety about

Running Head: The global impact of COVID-19 on learners

implications for future milestones (e.g., examinations, residency match). While the majority of medical students did not report the pandemic influenced their career interests, 11.4% of medical students reported increased interests in both Public Health and Infectious Disease as a result of the pandemic, as well as other clinical specialties (e.g., Emergency Medicine, Critical Care, Internal Medicine) and new interests in incorporating epidemiology into their future careers. Decreased interest in clinical careers and concerns about the impact of the pandemic on job prospects in their country were noted qualitatively.

Over half of medical students reported feeling under-utilized (53.8%); 52.4% wanted to assist clinically (52.4%) and felt comfortable doing so (54.8%). While 57.9% worried about the risk of exposure to the virus during rotations, 73.0% worried about the risk of exposure in the community. Over two thirds (70.6%) reported feeling worried about the disruption to their progression through medical training, with 45.0% worrying about their chances to match to residency. Only 21.0% thought the pandemic would have a minimal impact on their learning or skill development, and only 31.0% felt that it would have a minimal impact on their ability to enter residency with sufficient knowledge and skill to provide safe, high-quality care. The majority of students (58.0%) felt that the pandemic negatively affected their wellbeing.

Postgraduate Resident Learners

Residents were from a variety of specialties, mostly in urban settings. Three-quarters of residents agreed their learning was negatively impacted by COVID-19 and 60% felt it disrupted their career progression and timeline. Only 16% reported working more than normal during the pandemic and 36.7% working less than normal. Some residents felt adequately utilized (35.9%) or over-utilized (20.9%); however, 46.8% reported they could be better utilized. Over one-third felt comfortable providing patient care at this time, and 60.8% felt prepared to use personal protective equipment (PPE). Half of residents reported adequate knowledge of COVID-19 to provide care, 36.5% were prepared to be redeployed to other clinical services, and only 53% were worried about working in the hospital. 66.5% agreed that COVID-19 had negatively impacted their wellbeing. The qualitative data provided further evidence that residents felt under-utilized - but highlighted how they saw their re-deployment in a clinical setting as being in conflict with their educational goals.

Running Head: The global impact of COVID-19 on learners

Shared Questions

All scaled items had acceptable internal consistency ($\alpha > .7$) and factor loadings, suggesting reliability and validity evidence. Statistically significant differences were detected between levels of training ($p < .05$) and geographic regions ($p < .007$) for the items examining satisfaction with organizational responses [$t = 7.517, p < .000; [F(6,5258) = 73.85, p < .007]$], the impact of COVID-19 on wellness [$t = -7.774, p < .000 [F(6,5165) = 11.81, p < .007]$], and state-trait anxiety [$t = -4.710, p < .000; [F(6, 5131) = 10.48, p < .007]$] (Appendix C). In general, residents reported lower satisfaction with organizational responses ($x^2 = 15.67, 95\% \text{ CI} = 15.36-159.98$) as well as a greater negative impact on their wellbeing ($x^2 = 18.52, 95\% \text{ CI} 18.24-18.80$.) and anxiety ($x^2 = 15.13, 95\% \text{ CI} 14.83-15.42$). Learners from the East Asia and Pacific region were most satisfied with organizational responses, whereas learners from Sub-Saharan Africa and Latin America and Caribbean were least satisfied (Figure 2.1). Medical students from the Latin America and Caribbean region as well as residents from North America reported the largest negative impact of COVID-19 on their wellness (Figure 2.2). Residents from South Asia, Latin America and Caribbean reported the highest state-trait anxiety (Figure 2.3).

[Figure 2]

Seventy-four percent of residents and 57% of medical students reported being more anxious than usual (Table 3; Figure B.4). Common concerns were the health and wellbeing of family members, the impact of the pandemic on their learning, the health of the public, their personal health, the financial situation of others, and their personal financial situation (Figure B.3). One-quarter of participants identifying as Asian reported an increase in racist comments or behaviors in the clinical setting during COVID-19. Over half (54.7%) of learners living with a disability felt their school's response to the pandemic would further disadvantage them due to their disability.

[Table 3]

Some learners reported having to be in quarantine or isolation at the time of the survey. Nearly all learners were practicing physical and social distancing.

Running Head: The global impact of COVID-19 on learners

The qualitative data highlighted how normal education and training processes were severely disrupted by the pandemic (Appendix D). Learners identified a need for institutions to adapt and innovate in order to mitigate these impacts and continue education. Learners also desired to have input into their institutions' pandemic response. Strategies such as town halls, surveys, and learner representation on decision-making committees helped ensure their circumstances were accurately understood and enabled them to raise concerns overlooked by decision-makers.

Clear and effective communication during the pandemic was essential for learners, while poor or absent communication left learners uncertain of what was happening and contributed to their anxiety. Effective communication provided clarity and reassurance about the pandemic's impacts and the institutional response. Learners wished to be informed about impacts on their programs, details of the pandemic response, their role (including how to help), and resources they could access. Effective communications about these topics were clear, specific, decisive, concise, and reassuring. Irregular (sporadic) communication created an "information vacuum" that was filled by speculation, rumors, and misinformation. Overly frequent communication was overwhelming and led students to ignore institutional communications.

Numerous interventions were implemented in response to COVID-19, including virtual teaching strategies (e.g., Zoom, Microsoft Teams), office hours and town halls, and clinical strategies (e.g., patient handover via teleconference, alternating call schedules to minimize exposure). When done effectively, online learning maintained educational momentum and provided learners with motivation, a routine, and a sense of purpose. Self-directed learning was frequently used to augment online learning, and when provided with support and guidance, this motivated learners and provided them with a sense of progress. Programs with too much content overwhelmed them, whereas programs that provided minimal guidance left learners feeling aimless. Some participants stated that their program or school had done nothing in response to the pandemic, and that either their education had continued as usual or, in some instances, students were told to stay at home and self-direct their learning without any guidance from their program.

Running Head: The global impact of COVID-19 on learners

Discussion

This study provides empirical data about the impact of COVID-19 on medical education around the world, notably the effects on learning and wellbeing. Taken together, our findings highlight how learners have been impacted regardless of their program's response to the pandemic and whether or not they were removed from the clinical environment. However, the extent that COVID-19 has impacted learners differs significantly between levels of training and geographic regions.

COVID-19 has disrupted the traditional format and process of medical training for the vast majority of medical students and residents around the world. The rapid adoption of online learning by most schools may raise concerns about the quality of education (Mian & Khan 2020). Despite these concerns, equivalent educational outcomes between online and offline methods have been reported in the literature.(Pei & Wu 2019) The removal of learners from the clinical setting may diminish training (particularly for residents in time-based models of training), influencing clinical competence acquisition and career-decision making – all of which may affect patient care and health system outcomes (Goldhamer et al. 2020). While COVID-19 has required programs to adapt their curricula, this may be an opportunity to reconceptualize, innovate, and improve the current models of medical training, and ultimately catalyze broader educational transformation (Goldhamer et al. 2020; Sklar 2020).

Consistent with early reports, medical students feel under-utilized and have a strong desire to help out clinically during times of need (Lauren et al.; Herman et al. 2007; Gallagher & Schleyer 2020; Kalet et al. 2020; Li & Bailey 2020). However, not all learners may share these views. In addition to concerns about physical safety, some participants in our study believed the role of trainees is to be educated and that any deviation from that role is inappropriate. Others felt personally invested in contributing to care and viewed it as their personal calling and professional obligation. The optimal role of trainees during pandemics is complicated given their dual role as learners and healthcare providers – the extent to which each role is prioritized during emergencies remains debated. On one hand, it has been argued that medical students specifically, as an unpaid workforce, are not essential workers, and may increase disease transmission and

Running Head: The global impact of COVID-19 on learners

waste scarce supplies of PPE (Menon et al. 2020). In contrast, it can also be argued that medical students are a semi-skilled workforce that can alleviate the burden on residents and staff, and should gain experience in preparation for future pandemics when they will no longer be trainees. In one study, hospital leaders viewed medical students who graduated early to help during COVID-19 as “game changers” (Flotte et al. 2020). It has also been argued that medical education is equally important to patient care during a pandemic (Klasen et al. 2020). This may be a unique opportunity to cultivate leadership skills if learners are well-supported (Brand 2020). For learners in the clinical environment, supervision, feedback, and evaluation as well as access to adequate wellness supports remain crucial (Brand 2020; Klasen et al. 2020). The ethical and practical considerations of utilizing medical learners during a pandemic remains an ongoing point of discussion and needs to be weighed against potential benefits of learning and implications to patient care (Simonds & Sokol 2008; Bauchner & Sharfstein 2020).

COVID-19 is expected to affect the mental health of the public (Venkatesh & Edirappuli 2020) as well as that of healthcare professionals (Lai et al. 2020). Previous health emergencies and disruptions to training, such as SARS and Hurricane Katrina, have been shown to diminish the mental health of trainees and healthcare professionals (Kisely et al. 2020). Our study provides similar evidence but from a global perspective that the wellbeing of medical learners has been negatively impacted by COVID-19 across all levels of training and geographic regions. This is concerning given the existing evidence on the alarming prevalence of burnout and psychiatric morbidities in learners, as COVID-19 may amplify these pre-existing issues (Puthran et al. 2016; Frajerman et al. 2019; Quek et al. 2019; Hartzband & Groopman 2020). Pandemic responses have superimposed new stressors while exacerbating existing stressors for learners. The “anticipatory loss” associated with the disruption of traditional processes and milestones (e.g., electives, residency match, licensing exams) appears associated with anxiety, and front-line learners (e.g., residents) may be particularly prone to wellness stressors (Gallagher & Schleyer 2020; Li & Bailey 2020). Suggestions for mitigating the psychological consequences of COVID-19 on front-line care providers include clear communication, education, and psychological support, among others (Kisely et al. 2020).

Running Head: The global impact of COVID-19 on learners

This pandemic remains an ongoing challenge for medical education. While the uncertainty of COVID-19 required organizations to adopt a “worst-case scenario” approach, medical schools not only continue to react to the needs of the health system, but proactively plan for the future. While some participants in this study applauded their program’s response, it is important to learn from this experience and improve planning and policies for current and future emergencies that may disrupt medical education (O’Byrne 2020). Recommendations are increasingly being discussed in the literature (The Coalition for Physician’s Accountability Work Group on Medical Students in the Class of 2021; Kachra & Brown 2020; Klasen et al. 2020; O’Byrne 2020; The Association of Faculties of Medicine of Canada 2020). Considerations for medical educators synthesized from our results and existing recommendations are summarized in Table 4. We must continue to share innovations and key lessons amongst the global medical education community. Future research is warranted to understand the long-term impact and potential consequences of the COVID-19 on education, patient care, and health system outcomes.

[Table 4]

Limitations

We acknowledge that this study has several limitations, including the response and selection bias. The response rates from residents are low, potentially because they continued working clinically and the disruptions to their training were less extreme than for medical students who were completely removed from their training environments. Further, this study excluded participants who did not speak any of the 20 languages of the survey and there may be inconsistencies across the survey translations despite our best attempts to ensure questions and constructs translated accurately. Due to the public circulation of the survey, participants could not be validated as medical learners. A small fraction (3.5%) of participants did not specify their level of training and were excluded from the comparisons across levels of training. The geographic comparisons remain limited, as other classification systems (e.g., the World Health Organization regions) may have generated different results and there may be more pronounced differences between countries within similar regions (e.g., the United States vs. Canada). Finally, the variable responses to COVID-19 across countries and time is worth noting. Numerous qualitative comments highlighted how national responses informed the responses of professional

Running Head: The global impact of COVID-19 on learners

organizations and training programs. Future research could examine potential associations between temporality and the political and health system responses to examine how these factors may extend to influence medical learners (Pablos-Méndez et al. 2020).

Conclusions

This global study provides empirical data surrounding the profound impact that COVID-19 has had on medical learners, which can inform responses to the current pandemic, future disruptions to training, and future research. The results highlight the differences and similarities between levels of training and geographic regions. Despite the global shift toward online education, all education may not be created or perceived equally, as the results of this study suggest medical students fear their education will be of lower quality at this time. Both medical students and residents report their under-utilization, yet the role of the medical learner during a pandemic remains controversial. A delicate balance remains between medical training and the acute needs of the health system to ensure that both education and patient care remain safe. Finally, this study highlights how the COVID-19 pandemic has negatively impacted the wellbeing of medical learners globally, particularly those at the postgraduate level of training, which may be associated with their anxiety relating to the anticipatory losses of their educational experience. While the goal of this study was to broadly examine the impacts of COVID-19 on medical education, it highlights several areas for further exploration. Future research is warranted to better understand the implications of COVID-19 on learner outcomes and to generate evidence-based strategies surrounding how best to teach, engage, and support medical learners during similar events.

Running Head: The global impact of COVID-19 on learners

Practice Points

- The rapid reorganization of medical training in response to COVID-19 has been substantial across all levels of training and geographic regions
- Medical learners are concerned that the disruption will negatively influence their learning, training trajectory, and career outcomes.
- The majority of medical learners feel under-utilized and are motivated to help out during times of need
- The mental health and wellbeing of learners may be further diminished at this time
- Medical schools should ideally learn from this experience and improve planning and policies for current and future disruptions or emergencies

Running Head: The global impact of COVID-19 on learners

Table 2. Medical Student and Resident Specific Questions

Medical Students (N=5260)	N (%)
Clinical level students only: Did your medical school formally excuse you from clinical duties (i.e., clerkship rotations, other clinical rotations or experiences) as a result of the COVID-19 pandemic?*(N=2426 clinical level students)	
Yes	2044 (84.3%)
No	231 (9.5%)
Prefer not to answer	151 (6.22%)
Are you currently working clinically?	
Yes, I am currently working in my planned clinical rotations as a medical student	246 (4.7%)
Yes, I am currently working clinically but in other ways at this time	227 (4.3%)
No, I am not working clinically	2033 (38.7%)
No, I am not working clinically because I am in the pre-clinical stage of training	2483 (47.2%)
Prefer not to answer	271 (5.1%)
If your medical school has excused you from clinical duties or moved your scheduled curriculum to online learning modalities, did you leave or depart from your primary residence (i.e., where you live during the school year) to go to another location during this time? **	
Parent(s) or family member's house	2028 (38.6%)
Friend's house	58 (1.1%)
Somewhere else	132 (2.5%)
Did not leave	2624 (49.9%)
Prefer not to answer	135 (2.6%)
How are you currently spending your time during this time that was coordinated or organized by your medical school for aspects of your core curriculum (e.g., lectures or clerkship teaching sessions on Zoom)? (N=4938 valid responses)	
My learning/training has not been disrupted so I am spending my time as usual	757 (14.4%)
My learning is now online as coordinated by the medical school	3587 (68.2%)
I am engaging in self-directed learning	2322 (44.1%)
I am studying for licensing examinations	838 (15.9%)
I am working on research or scholarly projects	887 (16.9%)
I am volunteering	622 (11.8%)
I am helping with contact tracing	140 (2.7%)
I am taking this time to relax or rest	1913 (36.4%)
I am taking care of someone who is ill	123 (2.3%)
I am personally unwell and need to self-isolate	121 (2.3%)
I am spending this time taking care of my children/family	437 (8.3%)
I am taking this time to engage in more wellness activities than I usually would	1654 (31.4%)
Other	267 (5.1%)
Prefer not to answer	26 (0.5%)
If Yes to volunteering: How are you currently volunteering?*	
Contact tracing	102 (1.9%)
Call centres	122 (2.3%)
Screening centres	64 (1.2%)
Providing child care to healthcare professionals	79 (1.5%)
Providing child care to others	27 (0.5%)
Other	357 (6.8%)
Prefer not to answer	19 (0.4%)
Have you participated in any online learning during this time that was coordinated or organized by your medical school for aspects of your core curriculum (e.g., lectures or clerkship teaching sessions on Zoom)? (N=4938 valid responses)	
Yes	3997 (80.9%)
No	914 (18.5%)
Prefer not to answer	27 (0.5%)
If yes to Online learning: Do you feel that the quality of your medical education will be lower as a result of any online learning your school is coordinating at this time? (N=3919 valid responses)	
Yes	2608 (66.5%)
No	1225 (31.3%)
Prefer not to answer	86 (2.2%)
If yes to Online learning: Do you have any challenges accessing online learning modalities (e.g., Zoom, online lectures)? (N=3919)**	
I have difficulties accessing a computer	89 (2.0%)
I have difficulties accessing the internet	431 (11.0%)
I have difficulties learning from home	835 (21.0%)
I have other difficulties	202 (5.0%)
No, I do not have any difficulties accessing online learning	2743 (70.0%)
Prefer not to answer	31 (1.0%)
How has the COVID-19 pandemic directly impacted your clinical electives?	
My visiting electives at other institutions have been cancelled or postponed at this time	1027 (19.5%)
My core electives at my own medical school have been cancelled or postponed at this time	1235 (23.5%)
My electives have not yet been influenced at this time	203 (3.9%)
Not applicable, as all of my electives have been completed	213 (4.0%)
Prefer not to answer	110 (2.1%)
How has the COVID-19 pandemic influenced your career decision-making (e.g., residency interests, career planning)?^a	
It has influenced the residency program(s) I wish to apply to	564 (10.7%)
It has increased my interest in Public Health as a specialty	600 (11.4%)
It has increased my interest in Infectious Diseases as a specialty	600 (11.4%)
It has increased my interest in Family Medicine as a specialty	314 (6.0%)
It has increased my interest in other programs (open-ended)	268 (5.1%)
It has not influenced my career decision making or interests	2944 (56.0%)
Prefer not to answer	130 (2.5%)
Residents (N=1148 respondents for resident-specific items)	
Setting	
Urban	766 (66.7%)
Rural	121 (10.5%)
Other	23 (2.0%)
Prefer not to answer	238 (20.7%)
Program	
Anesthesiology	50 (4.4%)
Emergency Medicine	30 (2.6%)
Family Medicine	142 (12.3%)
Internal Medicine (core)	147 (12.8%)
Medical Subspecialty	38 (3.3%)
Neurology	11 (1.0%)
Obstetrics and Gynecology	45 (3.9%)
Pediatrics	42 (3.6%)
Public Health	28 (2.4%)
Psychiatry	42 (3.6%)
Radiology	19 (1.6%)
Surgery	113 (9.8%)
Other	290 (25.3%)
Prefer not to answer	
Are you working more than usual during the COVID-19 pandemic?	
Yes, I am working more than usual	184 (16.0%)
No, I am working the same amount	254 (22.1%)
No, I am working less than usual	421 (36.7%)
Prefer not to answer	289 (25.1%)
FM or Psychiatry Residents: Do you think residents in these programs could potentially be utilized at this time to provide peer-to-peer mental health support and/or counseling to other residents or healthcare professionals at this time over videoconferencing modalities (N=184)	
Yes, I think we could be useful to provide mental health supports at this time to any and all other residents at this time	89 (48.4%)
Yes, I think we could be useful to provide mental health supports at this time to residents who are working at the front lines of care, or who may be additionally stressed or burnt out as a result of the pandemic	66 (35.9%)
Yes, I think we could be useful to provide mental health supports at this time to other healthcare professionals (e.g., nursing) at this time	50 (27.2%)
No, I do not think we could be useful at this time in providing mental health supports to other residents	51 (27.7%)

^aparticipants could select all options that applied, % = of all respondents at that level

Table 3. Shared Questions

<i>Participants who selected any Asian race category: Have you noticed or experienced an increase in racist comments or behaviors towards you or other Asian individuals in the clinical setting since the emergence of COVID-19?</i>				Total (N=944)
(N=944)				
Yes				231 (24.5%)
No				631 (66.8%)
Prefer not to answer				82 (8.7%)
<i>Which of the following are concerns or stressors for you at this time?^b</i>				Total
My personal health and well-being	Medical Student	Resident	Did not specify level	2779
	2281	440	58	
The health and well-being of my family members	3518	605	87	4210
The health and wellbeing of the public	2761	509	72	3342
My personal financial situation	1391	200	51	1642
The financial situation of others	2089	339	57	2485
The impact of this pandemic on my learning	3046	468	71	3585
Other	253	83	9	345
<i>Would you consider yourself more anxious during this time than you typically are during the year?</i>				Total (N=5229)
Yes	Medical Student (N=4361)	Resident (N=737)	Did not specify level (N=151)	3117 (59.6%)
	2505 (57.4%)	547 (74.2%)	65 (49.6%)	
No	1779 (40.8%)	181 (24.6%)	51 (38.9%)	2011 (38.5%)
Prefer not to answer	77 (1.8%)	9 (1.2%)	15 (11.5%)	101 (1.9%)
<i>Are you practicing social or physical distancing?</i>				Total (N=5241)
Almost always	Medical Student (N=4367)	Resident (N=742)	Did not specify level (N=151)	3708 (70.7%)
	3206 (73.4%)	430 (58.0%)	72 (54.5%)	
As much as I can	1099 (25.2%)	293 (39.5%)	51 (38.6%)	1443 (27.5%)
Not at all	49 (1.1%)	13 (1.8%)	4 (3.0%)	66 (1.3%)
Prefer not to answer	13 (0.3%)	6 (0.8%)	5 (3.8%)	24 (0.5%)
<i>Have you had to quarantine or self-isolate?</i>				Total (N=5231)
Yes	Medical Student (N=4360)	Resident (N=741)	Did not specify level (N=151)	775 (14.8%)
	596 (13.7%)	160 (21.6%)	19 (14.6%)	
No	3749 (86.0%)	574 (77.5%)	103 (79.2%)	4426 (84.6%)
Prefer not to answer	15 (0.3%)	7 (0.9%)	8 (6.2%)	30 (0.6%)
<i>Are you being asked by others to provide medical expertise or information regarding the COVID-19 pandemic?^b</i>				Total
Yes – Family	Medical Student	Resident	Did not specify level	3077
	2477	529	71	
Yes – Friends	1965	452	60	2477
Yes – Others	591	180	23	794
No	1392	111	38	1541
Prefer not to answer	46	10	5	61
<i>Are you using social media to communicate to others about COVID-19?^a</i>				Total
Yes – Twitter	Medical Student	Resident	Did not specify level	654
	506	123	25	
Yes – Instagram	1065	135	37	1237
Yes – Facebook	1208	247	38	1493
Yes - Other	352	78	25	455
No	2220	347	45	2612
Prefer not to answer	58	9	11	78

^aN=respondents for each question; questions were not mandatory so total number of responses per question does not equal the total number of participants throughout the study; ^b“select all that apply” question, no proportions calculated

Running Head: The global impact of COVID-19 on learners
Table 4. Considerations for Medical Education During COVID-19

Area	Considerations for Medical Schools and Residency Programs
Teaching and Learning	<ul style="list-style-type: none"> Recognize that the rapid shift to online learning modalities likely requires ongoing evaluation, refinements, and improvement. Acknowledge that learners may have difficulties learning from home as well as challenges accessing a computer or the internet. Provide learners with self-directed learning resources with structure and guidance to promote student motivation and accountability. Simultaneously collect real-time feedback and use rapid-cycle improvement to promote continuous improvements while adapting new formats or processes. Identify potential innovations to maintain the fidelity and benefits of in-person learning, particularly for clinical skills. Consider integrating educational innovations created in response to COVID-19 into the core curriculum to be sustained after the pandemic. Scale what is working to other areas of your curriculum. Share success stories with others who may be struggling with similar challenges and could benefit from these strategies, particularly those in similar institutions (e.g., between residency programs). Conduct program evaluations of the new formats and processes adopted in response to COVID-19 to compare outcomes and provide evidence of merit and worth to learners and stakeholders.
Utilizing Learners	<ul style="list-style-type: none"> Recognize that learners may be highly motivated to help out clinically during times of need and consider potential opportunities to engage them in meaningful roles – especially medical students who have moved from their clinical rotations. Consider the training level, skillset, and experiences of learners. When appropriate, junior learners (e.g., medical students or junior residents) may be helpful to provide care in less acute settings or assist with low-risk roles to free senior residents and faculty to provide acute and intensive care. Provide learners working clinically with proper training on how to use personal protective equipment and provide care to COVID-19 patients. As learners have diverse needs, an individualized approach should be considered when engaging learners in the workforce – don't assume all learners want to help out clinically. Learners may also be able to help out in non-clinical ways, such as volunteering in the community. Continue providing learners with adequate supervision, feedback, and evaluation in the clinical setting as much as possible. Ensure safety equipment is available to learners in the clinical environments as well as health insurance if it is not already provided.
Supporting Learners	<ul style="list-style-type: none"> Recognize the potential burden of COVID-19 on learner well-being and proactively provide systemic and programmatic support, appropriate access to counselling, peer support systems, and social media support. Acknowledge that the diverse and unique needs of learners may differ for some groups at this time, including students who may have a disability, parents, caregivers, and international learners Approach medical learner well-being holistically to ensure that mental, physical, intellectual, social, and occupational wellness is achieved. Cultivate a culture of wellness both systemically and programmatically (upstream) so that learners are able to thrive (downstream) during their training as well as disruptive events such as COVID-19. Recognize that “anticipatory loss” of milestones may be associated with learner anxiety and try to mitigate concerns relating to these areas, including: cancellation of electives, reduced clinical exposure, concerns about career decision making, anxiety about career progression and obtaining employment, etc.
Communicating with Learners	<ul style="list-style-type: none"> Communicate with learners clearly, early, and often – but not too often. Use centralized and streamlined modalities to reduce information overload, such as an e-mail update or frequently updated website, rather than social media. Consider surveying learners to ask about their communication preferences and tailor the communication in response to their needs. Provide clear and concise updates to learners relating to the impacts of COVID-19 on their education, including changes to their program, timelines, and milestones. Be transparent about decision-making processes, outcomes, and contingency plans. Provide reassurance as much as possible and clearly communicate supports and resources to learners, such as institutional wellness resources, career counselling, academic advisors, peer supports, etc.
Policy, Planning, and Decision Making	<ul style="list-style-type: none"> Engage learners in the decision-making process as much as possible, and as early as possible. Include learners on planning committees and in the development of policies. Create avenues for learners to be engaged in decision-making and to provide feedback to administrators and decision-makers, such as town halls, open office hours, or surveys. Acknowledge the diverse experiences and needs of learners and allow for flexibility in solutions. For instance, recognize that some – but not all – junior learners may wish to help and that the health system may benefit from utilizing this skilled workforce. Provide multiple options to learners when possible to promote autonomy and flexibility. Develop a robust policies and procedures from this experience. Plan for how the program or institution will respond to disruptions to medical training, including any subsequent waves of COVID-19, future pandemics, climate change emergencies, etc.
