Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

20

21 Abstract

22 Background: The availability of a COVID-19 vaccine has been heralded as key to controlling
23 the COVID-19 pandemic. COVID-19 vaccination programme success will rely on public
24 willingness to be vaccinated.

25 Methods: We used a multi-methods approach – involving an online cross-sectional survey
26 and semi-structured interviews - to investigate the views of parents' and guardians' on the
27 acceptability of a future COVID-19 vaccine. 1252 parents and guardians (aged 16+ years)
28 who reported living in England with a child aged 18 months or under completed the survey.
29 Nineteen survey respondents were interviewed.

30 Findings: Most participants reported they would definitely accept or were unsure but
31 leaning towards accepting a COVID-19 vaccine for themselves (*Definitely 55.8%; Unsure but*
32 *leaning towards yes 34.3%*) and their child/children (*Definitely 48.2%; Unsure but leaning*
33 *towards yes 40.9%*). Participants were more likely to accept a COVID-19 vaccine for
34 themselves than for their child/children. Less than 4% of participants reported that they
35 would definitely not accept a COVID-19 vaccine for themselves or their children.

36 Participants that self-reported as Black, Asian, Chinese, Mixed or Other ethnicity were
37 almost 3 times more likely to reject a COVID-19 vaccine for themselves and their children
38 than White British, White Irish and White Other participants. Respondents from lower
39 income households were also more likely to reject a COVID-19 vaccine.

40 The main reason for vaccine acceptance was for self-protection from COVID-19. Common
41 concerns were around COVID-19 vaccine safety and effectiveness, which were largely
42 prompted by the newness and rapid development of the vaccine.

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

43 Conclusion: To alleviate concerns, information on how COVID-19 vaccines are developed
44 and tested, including their safety and efficacy, must be communicated clearly to the public.
45 To prevent inequalities in uptake, it is crucial to understand and address factors that may
46 affect COVID-19 vaccine acceptability in ethnic minority lower-income groups who are
47 disproportionately affected by COVID-19.

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

50 Background

51 Over 20.6 million cases of coronavirus (COVID-19) and almost 750,000 deaths have been
52 reported globally since the start of the COVID-19 pandemic to 13th August 2020 [1]. In
53 addition to the global mortality and morbidity costs attributed to COVID-19, the pandemic
54 and restrictions implemented to slow COVID-19 spread (i.e. lockdown, quarantine, curfew
55 and social distancing measures) have resulted in devastating social and economic
56 consequences. The pandemic has exacerbated global inequalities, with the world bank
57 predicting that 71 million people will be pushed into extreme poverty in 2020 [2].

58

59 According to COVID-19 mortality figures, the UK is one of the worst affected countries in the
60 world, with over 310,000 cases and 41,000 deaths reported as of 13th August 2020 [1, 3]. In
61 efforts to slow the spread of COVID-19 in the UK, stringent restrictions on movement were
62 enforced on 23rd March 2020, with the general public directed to only leave their homes to:
63 shop for basic essentials, take one form of exercise per day, access medical care or help a
64 vulnerable person, and to travel to and from work if absolutely necessary (where unable to
65 work from home) [4]. People most at-risk from COVID-19 were asked to protect themselves
66 by shielding from 23rd March 2020: staying at home at all times, for at least 12 weeks. In
67 addition, schools were closed to all but children of key workers or vulnerable children [4].

68

69 Although restrictions to slow COVID-19 spread have eased in many countries, including the
70 UK, day-to-day life globally remains distinctly marked by the COVID-19 pandemic, and
71 measures to prevent COVID-19 spread [5]. A COVID-19 vaccine has been heralded as key to
72 ending the pandemic [6]. With an accelerated process, in which development stages take

It is made available under a [CC-BY-NC-ND 4.0 International license](#) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

73 place in parallel, scientists aim to produce a COVID-19 vaccine within 12-18 months, at an
74 anticipated cost of at least \$3 billion for vaccine development, manufacture and delivery [7,
75 8]. In the UK, a Vaccine taskforce has been created to 'drive forward, expedite and co-
76 ordinate efforts to research and then produce a coronavirus vaccine and make sure one is
77 made available to the public as quickly as possible' [6]. On 20th July 2020, the UK
78 government secured early access to 90 million doses of promising COVID-19 vaccines,
79 'giving the UK the most likely chance of getting access to a safe and effective vaccine at the
80 quickest speed' [9].

81

82 In planning for the near-future availability of a COVID-19 vaccine, as well as focusing on how
83 to deliver COVID-19 vaccine programmes and ensure equitable vaccine allocation globally
84 [10], it is crucial to explore the acceptability of a COVID-19 vaccine to the public. The success
85 of any COVID-19 vaccination programme will depend on public willingness to receive the
86 vaccination.

87

88 The priority groups to receive a future COVID-19 vaccine in the UK are frontline National
89 Health Service (NHS) workers and social care workers, and those at increased risk of COVID-
90 19 (i.e. due to age or other risk factors, including underlying health conditions). It is not
91 currently known when or if children or adults not in risk groups for COVID-19 will be eligible
92 for a COVID-19 vaccine. Vaccinating young and healthy members of the population may help
93 to prevent COVID-19 transmission to high-risk groups. We conducted a multi-methods study
94 to investigate the views of parents and guardians in England on the acceptability of a future

It is made available under a [CC-BY-NC-ND 4.0 International license](#) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

95 COVID-19 vaccine, looking at their views on receiving a COVID-19 vaccine for themselves
96 and their children.

97

98 Methods

99 We used a multi-methods approach – combining qualitative and quantitative methods –
100 with the aim of gaining a more complete insight into the acceptability of a future COVID-19
101 vaccine. The study utilised a cross-sectional questionnaire survey and semi-structured
102 interviews, to quantify the prevalence of different views on COVID-19 vaccine acceptability,
103 and to explore reasons behind these views. The questions asked regarding COVID-19
104 vaccine acceptance were part of a larger study exploring parents' and guardians' views and
105 perceptions towards childhood vaccinations and use of NHS general practice services for
106 childhood vaccination during the COVID-19 pandemic

107

108 *Cross-sectional survey*

109 *Recruitment*

110 Survey recruitment took place between 19th April and 11th May 2020. Eligible participants
111 were required to be (1) a parent or guardian of a child (or children) aged 18 months or
112 under, (2) a resident of England, and (3) aged 16+ years.

113

114 We utilised an online social media strategy to recruit survey participants. This strategy
115 involved the creation of a Facebook page dedicated to the study with a single post
116 advertising the study, outlining the eligibility criteria for participation, and including the
117 hyperlink to the survey. An email was then sent to organisers of 284 baby and toddler play

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

118 groups in England. This contact email included a study summary and a request to share the
119 advertising post through the groups various means of communication (e.g. Facebook,
120 WhatsApp, Twitter or an email list). In addition to this, Facebook's paid promotion feature
121 was used to target the survey at eligible potential participants.

122

123 *Measures*

124 The survey included demographic questions concerning age, gender, household income,
125 employment, marital status of participants, and number and age of children. Two questions
126 were designed to capture acceptance of a new COVID-19 vaccination. The text of the
127 questions read "*If a new coronavirus (COVID-19) vaccine became available would you accept*
128 *the vaccine for yourself?*" and "*If a new coronavirus (COVID-19) vaccine became available*
129 *would you accept the vaccine for your child/children?*". A 4-point Likert scale was used to
130 encourage participants to take a stance on the vaccine (rather than selecting a 'do not
131 know' answer). The Likert scale options were "*Yes, definitely*", "*Unsure but leaning towards*
132 *yes*", "*Unsure but leaning towards no*" and "*No, definitely not*". Open-text boxes were
133 included for participants to explain their responses to the two questions on vaccine
134 acceptability for themselves and for their children. Participants could give more than one
135 reason in the open-text boxes.

136

137 *Analysis*

138 A paired samples t-test was used to compare acceptance of a COVID-19 vaccine for self and
139 for the participant's child. Two subsequent logistic regressions were then conducted to
140 determine the demographic factors associated with rejection of the COVID-19 vaccine for

It is made available under a [CC-BY-NC-ND 4.0 International license](#) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

141 both self-vaccination and that of the participant's child. Alpha was set to 0.05 for all tests.
142 Age, household income, ethnicity, location, and employment were included as predictive
143 variables in the logistic regression models. In the logistic regression model for child
144 vaccination, number of children was also included as a predictive variable.

145

146 To perform the logistic regressions ethnicity was dichotomised into '*White*' (i.e. White
147 British, White Irish and White Other participants) and '*Black, Asian or minority ethnic*
148 (*BAME*)' (i.e. Black, Asian, Chinese, Mixed or Other ethnicity). Household income brackets
149 were reduced to a "*low income*" (<£35,000), "*medium income*" (£35,000 - £84,999) and
150 "*high income*" (>£85,000), and the vaccine acceptance variables were dichotomised into
151 "*likely to accept*" (those that answered *Yes, definitely* or *Unsure but leaning towards yes*)
152 and "*likely to reject*" (those that answered *No, definitely not* or *Unsure but leaning towards*
153 *no*).

154

155 Free text responses were analysed thematically in Microsoft Excel. Coding schemes were
156 produced based on the content of the free-text comments.

157

158 *Semi-structured interviews*

159 On completing the survey, participants were asked to provide their contact details if
160 interested in taking part in a follow-up semi-structured interview. Participants that had
161 expressed interest were purposively selected based on a range of characteristics, including
162 ethnicity, household income, and geographical location.

163

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

164 Participants were emailed an information sheet, fully detailing the study objectives and
165 explaining all aspects of participation, including the right to withdraw from the research.
166 Written informed consent was obtained from each participant. Interviews lasted
167 approximately 30 minutes and were conducted over the phone. Topic guides, shaped
168 around the content of the questionnaire, were used to assist the interviews. Interview
169 participants received a £10 gift voucher as a thank you for their time and contribution. The
170 interviews took place between 27th April and 27th May 2020.

171

172 Interviews were transcribed verbatim and analysed thematically in NVivo12 using the stages
173 outlined by Braun and Clarke [11]: data familiarisation, coding and theme identification and
174 refinement. To enhance the rigour of the analysis, coding approaches and data
175 interpretations were discussed between SB, RC, PP and SM-J.

176

177 Public involvement

178 We gained feedback from parents with young children, including children aged 18 months
179 or under, in the refinement of the survey questions and layout. This involvement aimed to
180 increase the user-friendliness and appropriateness of the survey.

181

182 Findings

183 1252 parents and guardians completed the survey (see participant characteristics in Table
184 1). Most survey participants were female (95.0%), raising a child/children with a partner
185 (97.0%), and identified as being White British, White Irish or White Other (94.1%). The age
186 range of participants was 18-48 years (Mean=32.95, SD=4.565). Median household income

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

187 was reported as £55,000-£64,999. Of the survey participants, 1049 (83.8%) left free-text
188 responses to the open text survey questions.

189

190 **INSERT TABLE 1 HERE**

191

192 43.3% of survey participants (n=530) provided their details to be contacted for a follow-on
193 interview. In total, 61 parents were contacted to participate. Of these 19 took part in
194 interviews (18 women and one man), 39 did not respond to recruitment emails, two
195 responded initially but did not follow through with an interview. The characteristics of
196 interviewees are outlined in Table 2.

197

198 **INSERT TABLE 2 HERE**

199

200 *Quantitative findings - Acceptability of a future COVID-19 vaccination*

201 A high proportion of survey participants reported that they would definitely accept or were
202 unsure but leaning towards accepting a COVID-19 vaccine for themselves (*Yes, definitely*
203 *55.8%, n=699; Unsure but leaning towards yes 34.3%, n=429*) and their child/children (*Yes,*
204 *definitely 48.2%, n=604; Unsure but leaning towards yes 40.9%, n=512*) (Table 3). Less than 1
205 in 10 participants reported that they were unsure but leaning towards rejecting or would
206 definitely reject a COVID-19 vaccine for themselves (*Unsure but leaning towards no 6.2%,*
207 *n=78; No, definitely not 3.7%, n=46*) and their child/children (*Unsure but leaning towards no*
208 *7.4%, n=93; No, definitely not 3.4%, n=43*).

209

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

210 Participants were more likely to say that they would definitely accept or were leaning
211 towards accepting a COVID-19 vaccine for themselves (mean = 2.42, SD = .768) than for their
212 child/children (mean = 2.34, SD = .761), $t(1251) = 7.636$ $p < .001$.

213

214 **INSERT TABLE 3**

215

216 *Survey open-text and interview findings: main reasons for accepting the vaccine (Figure 1)*

217 Of the survey participants that stated they would definitely accept or were unsure but
218 leaning towards accepting a COVID-19 vaccine for themselves (n=1128), 897 left an open-
219 text reason (79.5%). 231 participants did not complete the open text (20.5%). Of the
220 participants that stated they would definitely accept or were leaning towards accepting a
221 COVID-19 vaccine for their child (n=1116), 925 (82.9%) gave a reason for definitely accepting
222 or leaning towards accepting a COVID-19 vaccine for their child. 191 participants did not
223 complete the open text (17.1%).

224

225 All interviewees said that they would definitely accept or were unsure but leaning towards
226 accepting COVID-19 vaccine for themselves in their survey responses. Sixteen interviewees
227 said they would definitely accept or were leaning towards accepting a COVID-19 vaccine for
228 their children in their survey responses (see Table 2). Interestingly, one interviewee (#19)
229 that was leaning towards accepting the vaccine at the time of completing the survey was
230 leaning towards refusing the vaccination (for herself and her child) at the time of interview.

231

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

232 The following reasons were given for COVID-19 vaccine acceptance for self and for
233 child/children, in order of how often they were mentioned by survey participants and
234 importance to interviewees.

235 *To protect self and others*

236 Of survey participants expressing positive intentions to vaccinate and leaving an open-text
237 response, the most prevalent reason was to provide protection from COVID-19 to the
238 person being vaccinated (*for self* n=380, 42.4%; *for child* n=393, 42.5%), followed by
239 protecting other people (*for self* n=213, 23.7%; *for child* n=180, 19.5%), including family
240 members (*for self* n =109, 12.2%; *for child* n=49, 5.3%). Participants also reported that they
241 would vaccinate to protect someone known to them in a risk group for COVID-19 (*for self*
242 n=74, 8.2%; *for child* n=29, 3.1%). 5.0% (n=45) of survey participants specifically mentioned
243 that they wanted to receive the vaccine to stay healthy to look after their child/children.
244 Interviewees also corroborated these findings, highlighting that vaccinating would make
245 them feel safer in visiting older family members.

246 *'... for us, I definitely want that. I'd want us protected as a family. You*
247 *know, my parents, his [partner's] parents are ageing, so we'd be going to*
248 *see them, and I don't want to put them at risk. So, certainly, I think it's*
249 *really important.'* (Interview #13)

250
251 Several survey participants cited that they would vaccinate as they were key workers (e.g.
252 involved in health and social care, education and childcare, or the food sector) and in
253 frequent contact with other people (n=60, 6.7%). Health and social care workers particularly
254 noted a need to vaccinate to protect themselves and 'at risk' patients and clients.

255

It is made available under a [CC-BY-NC-ND 4.0 International license](#) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

256 *Vaccination as a route to 'returning to normal life'*

257 For several interviewees, the availability of a vaccine was viewed as the only way of ending
258 social-distancing measures and returning to normal life. Interviewees talked about
259 lockdown as being financially unsustainable, and detrimental to physical and mental
260 wellbeing and children's educational and social development. Interviewees that were
261 shielding during the pandemic were particularly keen to accept a future vaccine, with one
262 parent who had looked into entering a COVID-19 vaccine trial saying *they 'would be first at*
263 *the door'*.

264

265 Survey participants also indicated that they would be vaccinated (n=33, 3.7%) and get their
266 children vaccinated (n=24, 2.6%) as a means of stopping the need for social distancing.

267

268 *Trust and belief in the importance of vaccination*

269 Survey participants indicated that they would receive the vaccine for themselves (n=46,
270 5.1%) or their child/children (n=65, 7.0%) if it was recommended by the government or
271 healthcare workers. Survey participants cited their belief in the importance of vaccination as
272 a reason to receive the vaccination themselves (n=35, 3.9%) or to vaccinate their children
273 (n=50, 5.4%).

274

275 A proportion of survey participants specifically reported trust in vaccinations, science or
276 healthcare workers as a prompt to vaccinate their child/children (n=38, 4.1%) and
277 themselves (n=24, 2.7%).

278

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

279 *Less risk in vaccinating adults*

280 Interviewees discussed a greater willingness to 'risk' receiving the vaccination for
281 themselves than for their children due to safety concerns. Survey participants also reported
282 the perception that it was less risky to vaccinate adults than children (n=29, 3.2%) as the
283 vaccine trials were conducted in adults.

284

285 **INSERT FIGURE 1 HERE**

286

287 *Survey open-text and interview findings: main reasons for not accepting the vaccine (Figure*
288 *2)*

289 Of the participants that stated they would definitely reject or were unsure but leaning
290 towards rejecting a COVID-19 vaccine for themselves, 100 left an open-text reason (80.6%)
291 and 24 did not give an open-text reason (19.4%). 124 (91.2%) gave a reason for definitely
292 rejecting or leaning towards rejecting a COVID-19 vaccine for their child and 12 did not give
293 an open-text reason (8.8%). Three interviewees reported that they were unsure but leaning
294 towards rejecting a COVID-19 vaccine for their child/children (see Table 2).

295

296 The following reasons were given for COVID-19 vaccine rejection by survey participants and
297 interviewees.

298

299 *Vaccine safety and effectiveness concerns*

300 The most common concerns expressed by survey participants about a COVID-19 vaccine
301 were around vaccine safety (*for self* n=49, 49.0%; *for child* n=77, 62.1%) and effectiveness

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

302 (for self n=11, 11.0%; for child n=10, 8.1%), which were largely prompted by the newness
303 and rapid development of the vaccine (for self n=50, 50.0%; for child n=84, 67.7%), and the
304 newness of COVID-19 (for self n=3, 3.0%; for child n=5, 4.0%). Participants were worried that
305 the development process might be too rapid, not allowing enough time for adequate testing
306 to confirm the vaccine's short and long-term safety, and also vaccine effectiveness.

307

308 These concerns were echoed by interviewees who had reservations around how a vaccine
309 developed in a fraction of the usual timeline for vaccine development could be confirmed as
310 safe.

311 *'I'm very pro-vaccines in general, but my main concern was as long as it*
312 *hasn't been rushed through. As long as we know it's safe and all the proper*
313 *tests have been done, and, you know, when you sort of heard things in the*
314 *news like well, it's been 18 years and they haven't developed a SARS*
315 *vaccines, or whatever it was that was sort of banded around yesterday, it*
316 *sort of makes you go, why is that? So, I think that if a vaccine was to come*
317 *out like this one could do in a hurry it need to have associated information*
318 *to how this has been able to happen so quickly.'* (Interviewee #19)

319

320 Some survey participants and interviewees wanted to 'wait-and-see' if the vaccination was
321 safe before being vaccinated themselves, or getting their children vaccinated. One
322 interviewee discussed preferring for her family to remain in lockdown for longer (i.e. living
323 for a longer duration with the restrictions implemented on 23rd March 2020), to allow more
324 time for vaccine development and safety testing. This interviewee acknowledged this
325 situation as not a financially viable option for those unable to work from home.

326

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

327 *Children less at risk of COVID-19*

328 Some survey participants expressed a lack of benefit to vaccinating their children, citing that
329 children are hardly affected, are at lower risk of severe COVID-19 infection than adults
330 (n=24, 19.4%), and less likely to catch or transmit COVID-19 (n=4, 3.2%). Participants and
331 interviewees discussed the decision to vaccinate their children in terms of balancing
332 potential advantages and disadvantages. The perception that children are less at risk of
333 COVID-19 was combined with safety concerns as a reason not to vaccinate.

334 *'Any vaccine for covid-19 will have been produced in a huge hurry, possibly*
335 *bypassing some of the normal processes and procedures that ensure*
336 *safety. As small children have a very low risk of being seriously ill from the*
337 *virus, I'm not sure I would risk it. I would encourage my mum, who is 70*
338 *with underlying health conditions, to take it though as the risk /reward is*
339 *different.'* (Survey participant #1095)

340

341 Several survey participants indicated that they would be more likely to get their
342 child/children vaccinated if this was beneficial in reducing COVID-19 spread to older people
343 and clinical risk groups.

344

345 *Low perception of risk*

346 Some survey participants indicated not needing the vaccine as they (n=16, 16.0%) and their
347 child/children (n=4, 3.2%) were 'fit and healthy' and not in an at-risk group. 2% of
348 participants (n=2) indicated that it was better to prioritise 'at-risk' groups for vaccination.

349

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

350 *Already had COVID-19*

351 A small number of survey participants indicated that they would not accept a COVID-19
352 vaccine for themselves or their child/children as they (n=6, 6.0%) or their child (n=4, 3.2%)
353 had already had COVID-19.

354

355 *Need for transparency to make an informed vaccine decision*

356 To be able to make an informed choice about vaccination, parents expressed a need for
357 transparent information on vaccine development, vaccine efficacy and vaccine safety. A lack
358 of vaccine information at present was given as a reason not to accept the vaccine for a
359 minority of survey participants for their children (n=6, 4.8%) and for themselves (n=1, 1.0%).
360 One interviewee also discussed that the information should come from trusted sources such
361 as healthcare professionals, the NHS and Public Health England.

362 *'...if the NHS is telling you something you're more likely to believe it,*
363 *whereas if it's a politician, you know, you've got much more incentive to*
364 *think, "Well, are they telling the truth?" (Interviewee #17)*

365

366 *Lack of trust*

367 A small number of survey participants stated a lack of trust in vaccinations, science or the
368 medical profession as a reason to not accept a vaccine (*for self* n =4, 4.0%; *for child* n =2,
369 1.6%).

370

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

372 *Quantitative findings – Factors associated with COVID-19 vaccine rejection for self*

373 A forward stepwise logistic regression analysis was performed with a dichotomised version
374 of the self-vaccination against COVID-19 variable as the discrete variable. *Age, household*
375 *income, ethnicity, location* and *employment* were included as predictive variables. The final
376 model included three predictor variables (*household income, employment* and *ethnicity*) and
377 significantly predicted 'Likely to reject' (omnibus chi-square = 50.225, df = 7, $p < .001$). *Age*
378 and *location* did not significantly predict 'Likely to reject', as such they are excluded from
379 the model. The Hosmer-Lemeshow test demonstrates that the model adequately fits the
380 data chi-square = 4.239, df = 7, $p = .752$. Table 4 gives coefficients and the Wald statistic,
381 odds ratio and associated degrees of freedom for each of the predictor variables.

382

383 Participants in the lower household income bracket (<£35,000) were almost twice (OR: 2.08,
384 95%CI: 1.31 – 3.3) as likely to reject a COVID-19 vaccine than participants with a medium
385 household income (£35,000-£84,999). Those in the highest income bracket (>£85,000) were
386 almost three times (OR: 0.35, 95%CI: 0.17 – 0.73) as likely to accept the vaccine as middle-
387 income bracket participants (£35,000-£84,999).

388

389 Participants that self-reported as Black, Asian, Chinese, Mixed or Other ethnicity were 2.7
390 times (95%CI: 1.27 – 5.87) more likely to reject a COVID-19 vaccine than White British,
391 White Irish and White Other participants. There was also some indication that those that
392 identify their employment as *homemaker* were more likely to reject the vaccination than
393 those in full time employment or on parental leave from full time employment.

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

394 **INSERT TABLE 4 HERE**

395 *Quantitative findings – Factors associated with COVID-19 vaccine rejection for child*

396 A forward stepwise logistic regression analysis was performed with a dichotomised version
397 of the child vaccination against COVID-19 variable as the discrete variable. *Age, household*
398 *income, ethnicity, location, employment and number of children* were included as predictive
399 variables. The final model included three predictor variables (*income, ethnicity and number*
400 *of children*) and significantly predicted 'Likely to reject' (omnibus chi-square = 37.896, df = 6,
401 $p < .001$). *Age, location and employment* did not significantly predict 'Likely to reject', as
402 such they were excluded from the model. The Hosmer-Lemeshow test demonstrates that
403 the model adequately fits the data chi-square = 1.502, df = 6, $p = .958$. Table 5 gives
404 coefficients and the Wald statistic and associated degrees of freedom and probability values
405 for each of the predictor variables.

406

407 Similarly, to accepting a novel covid-19 vaccination for themselves, participants that self-
408 reported as Black, Asian, Chinese, Mixed or Other ethnicity were 2.74 times (95%CI: 1.35 –
409 5.57) more likely to reject a COVID-19 vaccine for their child than White British, White Irish
410 and White Other participants. This finding was also found for income, with participants in
411 the lower household income bracket (<£35,000) being 1.8 times (95%CI: 1.17 – 2.82) as
412 likely to reject a COVID-19 vaccine for their child than participants with a medium household
413 income (£35,000-£84,999). Participants with more than four children were also found to be
414 around four times (OR 4.13; 95%CI: 1.873 – 9.104) more likely to reject the vaccination for
415 their children than those with only one child, however, caution should be taken with this
416 finding due to the small sample size.

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

417 **INSERT TABLE 5 HERE**

418 **Discussion**

419 In this mixed methods study, the majority of parents and guardians reported they would
420 definitely accept or were unsure but leaning towards accepting a COVID-19 vaccine for
421 themselves (*Yes, definitely* 55.8%, n=699; *Unsure but leaning towards yes* 34.3%, n=429) and
422 their child/children (*Yes, definitely* 48.2%, n=604; *Unsure but leaning towards yes* 40.9%,
423 n=512). Less than 4% of parents and guardians reported that they would definitely not
424 accept a COVID-19 vaccine for themselves or their children.

425

426 Attitudes towards a COVID-19 vaccine appear more positive in our study (in terms of the
427 proportion of participants reporting they would definitely accept or were leaning towards
428 accepting vaccination) than those reported in surveys conducted with adults in France,
429 Germany, Italy, Portugal, the Netherlands and the US [12-14], and comparable to reports
430 from Denmark and Australia [13, 15]. However, this could be due to differences in the
431 questions asked; highlighting the need for cross-country surveys and consistency in the
432 wording of questions. These surveys indicate that the difference in vaccination acceptance
433 ranges greatly between countries, from around 62% in France to 80% in Denmark and the
434 UK [13], and are reflective of trust in vaccines and health systems more broadly, and in
435 governments. More positive attitudes towards COVID-19 vaccination in our study appear to
436 reflect the high level of parent trust in vaccines in the UK, and trust in the NHS.

437

438 The main reasons, or 'pros' for vaccinating, were to protect the individual being vaccinated
439 against COVID-19, followed by protecting others from the disease. Uncertainties around

It is made available under a [CC-BY-NC-ND 4.0 International license](https://creativecommons.org/licenses/by-nc-nd/4.0/) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

440 vaccine safety, effectiveness, and the benefit of vaccinating children were the most
441 prevalent reasons given for COVID-19 vaccine refusal. Safety and effectiveness concerns
442 were prompted by fears that the accelerated vaccine development process, considered
443 politically motivated, could result in cutting corners. Comparably, previous research also
444 suggests that people consider older vaccines safer than newer ones [16, 17], and highlights
445 the importance of transparency in communicating about the vaccine development process
446 and of vaccination safety testing.

447

448 When a COVID-19 vaccine is launched, should any safety signals or safety concerns arise, it
449 will be key for government and public health officials to reassure the public with
450 transparency, action, accountability and timeliness in order to avoid any detrimental impact
451 of the new vaccine on the current national immunisation programme. The Dengvaxia
452 controversy in the Philippines highlights how safety concerns around a newly launched
453 vaccine, Dengvaxia, can derail a successful national immunisation programme leading to
454 drops in childhood vaccine uptake, and even spill over to other health care treatments [18].

455

456 Other surveys have identified that views on COVID-19 vaccine acceptance are influenced by
457 vaccine efficacy and perceptions of disease risk. In a cross-sectional survey conducted in
458 Indonesia, Harapan et al [19] found that 93.3% of participants would receive a COVID-19
459 vaccine that was 95% effective but only 67.0% of participants would accept a 50% effective
460 vaccine. The authors also found that acceptance was higher amongst participants that
461 considered themselves at greater risk of COVID-19 infection.

462

It is made available under a [CC-BY-NC-ND 4.0 International license](#) .

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

463 In our study, lower levels of vaccine acceptance for children were discussed by parents in
464 terms of children being at lower-risk of COVID-19. Evidence suggests that children have
465 lower susceptibility to COVID-19 [20], very few children develop severe COVID-19 (even if
466 they are in a clinical risk group), and their role in the transmission of COVID-19 is unclear
467 [21]. Similarly with influenza vaccination, parents and guardians in our study more often
468 considered the perceived benefits to their child, rather than societal benefits, as a reason to
469 vaccinate their children [22].

470

471 Acting now to prevent inequalities in COVID-19 vaccine uptake

472 We found that participants of Black, Asian, Chinese, Mixed or Other ethnicity reported were
473 more likely to reject a COVID-19 vaccine for themselves and their child/children compared
474 to White participants (i.e. White British, White Irish or White Other). Comparably, lower
475 levels of COVID-19 vaccine acceptability in Black African and lower income groups have
476 been reported in US based surveys [14]. This is of concern given the evidence that Black,
477 Asian and minority ethnic (BAME) groups and people living in the most deprived areas are at
478 higher risk of acquiring COVID-19 infection and at increased risk of death from COVID-19
479 [21]. Inequalities in vaccination uptake amongst BAME communities [23-26] and lower
480 income groups [26, 27] already exist for certain vaccines and a concerted effort must be
481 made to understand factors affecting vaccine acceptance and prevent ethnic inequalities in
482 uptake of a future COVID-19 vaccine. We were unable to explore ethnic differences in
483 COVID-19 vaccine acceptance due to insufficient representation of ethnic minority groups in
484 writing free-text responses and agreeing to participate in interviews.

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

486 *Strengths and limitations*

487 The quality of the study was enhanced through the use of a multi-methods approach in
488 which interview and open-text responses were used to develop insight into factors
489 underpinning quantitative responses. Our study took place at the height of the COVID-19
490 pandemic in England and a survey repeated now that we are 'past the peak' of COVID-19
491 cases and deaths and lockdown has been eased may yield different responses. This has
492 already been indicated in the second wave of a large European survey looking at COVID-19
493 vaccine attitudes [28]. This highlights the need for longitudinal studies to measure the
494 acceptability of a COVID-19 vaccine at different intervals.

495

496 Our recruitment strategy, using social media, achieved a high number of responses
497 (n=1252). Although geographically representative, our participants were not overly
498 representative in terms of household income and ethnicity. This meant that it was not
499 possible to explore differences in vaccination views by ethnicity and household income
500 when looking at open-text responses and conducting interviews.

501

502 **Conclusion**

503 The success of COVID-19 vaccination programmes will rely heavily on public willingness to
504 accept the vaccine. The main concerns raised by parents in our study were around the
505 safety and effectiveness of a 'rushed' and new COVID-19 vaccine. To alleviate these
506 concerns, there needs to be clear communication and transparency as to how COVID-19
507 vaccines are developed and tested, and safety and efficacy information.

Parents' and guardians' views on the acceptability of a future Covid-19 vaccine: a multi-methods study in England

509 Opening up a conversation with members of the public at an early stage is key to
510 understanding factors that may affect vaccine acceptability, and developing approaches to
511 allay any concerns. This must happen in parallel with efforts to develop a COVID-19 vaccine.
512 Importantly, efforts must be made to understand and address factors that may affect
513 COVID-19 vaccine uptake in Black, Asian and minority ethnic groups and lower-income
514 households who are disproportionately affected by COVID-19.

515

516 Ethical approval

517 Ethical approval was granted by the London School of Hygiene & Tropical Medicine
518 Observational Research Ethics Committee (study reference: 21879).

519

520 Acknowledgements

521 We would like to thank the baby and toddler group leads who helped share the online
522 survey with potential participants. We are especially grateful for the time and contribution
523 of all parents and guardians who took part in the study.

524
