41 **Abstract**

42 **Background** Italy has been one of the countries most affected by the SARS-CoV-2
43 pandemic and the regional healthcare system has had to quickly adapt its
44 organization to meet the needs of infected patients. This has led to a drastic change
45 in the routine management of non-communicable diseases with a potential long-term
46 impact on patient health care. We investigated the management of non-COVID-19
47 patients across all medical specialties during the pandemic in Italy.

48 **Methods** A PRISMA guideline-based systematic review of the available literature
49 was performed using PubMed, Embase, and Scopus, restricting the search to the
50 main outbreak period in Italy (from 20 February to 25 June, 2020). We selected
51 articles in English or Italian that detailed changes in the Italian hospital care for non-
52 COVID-19 patients due to the pandemic. Our keywords included all medical
53 specialties in combination with our geographical focus (Italy) and COVID-19.

54 **Findings** Of the 4643 potentially eligible studies identified by the search, 247 studies
55 were included in the systematic review. A decrease in the management of
56 emergencies in non-COVID patients was found together with an increase in
57 mortality. Similarly, non-deferrable conditions met a tendency toward decreased
58 diagnosis. All specialties have been affected by the reorganization of healthcare
59 provision in the hub-and-spoke system and have benefited from telemedicine during
60 the pandemic.

61
62 **Interpretation** Our work highlights the changes taking place in the Italian public
63 healthcare system in order to tackle the developing health crisis due to the COVID-
64 19 pandemic. The findings of our review may be useful to analyze future directions
65 for the healthcare system in the case of new pandemic scenarios.

72 **Introduction**

73

74 Since the first case of the novel coronavirus (COVID-19) was reported in Wuhan,
75 China in December 2019, viral infection spread at an alarming rate worldwide. On
76 January 30, 2020, the World Health Organization (WHO) described COVID-19 as a
77 Public Health Emergency of International Concern, and by March 11, 2020, it was
78 officially declared a pandemic.¹ Italy was the first European country to be affected by
79 COVID-19 with the first case being diagnosed on 20 February in a man living in the
80 province of Lodi (NorthWest Italy).² The epidemic went on to affect all regions in
81 Italy, with higher incidence rates in the north. The peak of the COVID-19 epidemic in
82 Italy was reached in the last week of March with over 5500 new cases per day.

83 There has been a gradual decline since then as a result of strict containment
84 measures that shaped the Italian lockdown phase. However, especially during the
85 first phase of the epidemic, the outbreak put the Italian National Health System
86 (Servizio Sanitario Nazionale, SSN) under unprecedented pressure.

87 In an attempt to direct the available resources at counteracting and limiting the
88 effects of the pandemic, deferrable and non-urgent medical activities were
89 suspended. On the other hand, patients with life-threatening conditions, such as
90 myocardial infarction and stroke, or chronic conditions, such as diabetes, retained
91 the right to their medical needs being met.

92 In these circumstances, several medical domains have been constrained by different
93 resource allocations with unpredictable long-term consequences on patient health
94 care.^{3,4,5}

95 Here, we present a systematic review of the literature which illustrates the direct and
96 indirect effects of the COVID-19 pandemic on the management of non-COVID
97 patients across all medical specialties.

98

99 **Methods**

100

101 This systematic review was performed in accordance with PRISMA guidelines.⁶ The
102 search was conducted on 25 June 2020 on three different databases: PubMed,
103 Embase, and Scopus without any date restriction. All the keywords were investigated
104 within the title and abstract in both “AND” and “OR” combinations. Our keywords

105 included all medical specialties (and potential synonyms) in combination with our
106 geographical focus (Italy or Italian) and COVID-19. The full search strategy is
107 reported in Table 1, Supplementary Material.

108

109 *Selection of the studies*

110 The literature search returned original papers published between 1979 and 2020 –
111 especially for the keyword “coronavirus”. Since our focus was the novel severe acute
112 respiratory syndrome coronavirus 2 (SARS-CoV-2) and the first positive case in Italy
113 was detected on 20 February, the literature search was restricted to the period from
114 20 February to 25 June 2020. The databases were queried via an R script on their
115 respective APIs, checked and cleaned for duplicates (via title, DOI and/or database
116 id), and exported into Excel.

117 In the second stage, studies were selected based on their titles and abstracts: each
118 study was independently evaluated by three different raters (AnB, GA, GL). When
119 there was a lack of agreement among the screeners, ensemble majority voting was
120 used for the final decision. The full texts of the selected papers were thus analyzed
121 by two reviewers in terms of relevance and inclusion/exclusion criteria (MMO and
122 GA). When these reviewers disagreed over the inclusion or exclusion of a paper, a
123 third reviewer was responsible for the final decision (GL). In addition, the reference
124 lists of selected papers were reviewed in order to find pertinent studies not identified
125 during the initial search.

126

127 *Inclusion and exclusion criteria*

128 The simultaneous co-occurrence of the following characteristics was considered for
129 the inclusion of articles: (i) articles focusing on the SARS-CoV-2 infection/COVID-19
130 disease; (ii) articles focusing on the impact on patients based in Italy or on the Italian
131 hospital organization; (iii) articles detailing COVID-19-associated changes in the
132 Italian hospital care for non-COVID-19 patients. All the investigated articles were
133 published in English or Italian.

134

135 *Type of studies*

136 Original papers, editorials, comments, research letters, case series and studies
137 focusing on non-COVID patients in Italy were included.

138

139 *Data extraction and quality assessment*

140 Data were extracted from the papers by one of the investigators (TP) and were
141 subsequently checked for accuracy by other reviewers (GL, AnB). Disagreements
142 regarding data extraction among reviewers were solved by consensus. Extracted
143 data included: type of medical specialty involved (surgical, medical, or public health),
144 geographical location (north, south, centre or nationwide), type of patients
145 (COVID/non-COVID), type of study (article or research letter/comment/editorial). No
146 quality assessment was possible as over 32% of entries were not articles but
147 consisted of comments, research letters, opinions or editorials – for which no quality
148 guidelines are available.

149

150 *Investigated Outcomes*

151 This systematic review investigated the impact of the COVID-19 pandemic on
152 patients' healthcare provision and hospital organization in Italy. Our primary goal was
153 to identify potential short-term and long-term effects on the health of non-COVID
154 patients. Our secondary goals were to identify: (i) organizational and/or clinical
155 settings and decisions that were particularly effective (or counterproductive) during
156 the pandemic; and (ii) similarities and differences across medical specialties and
157 regional areas.

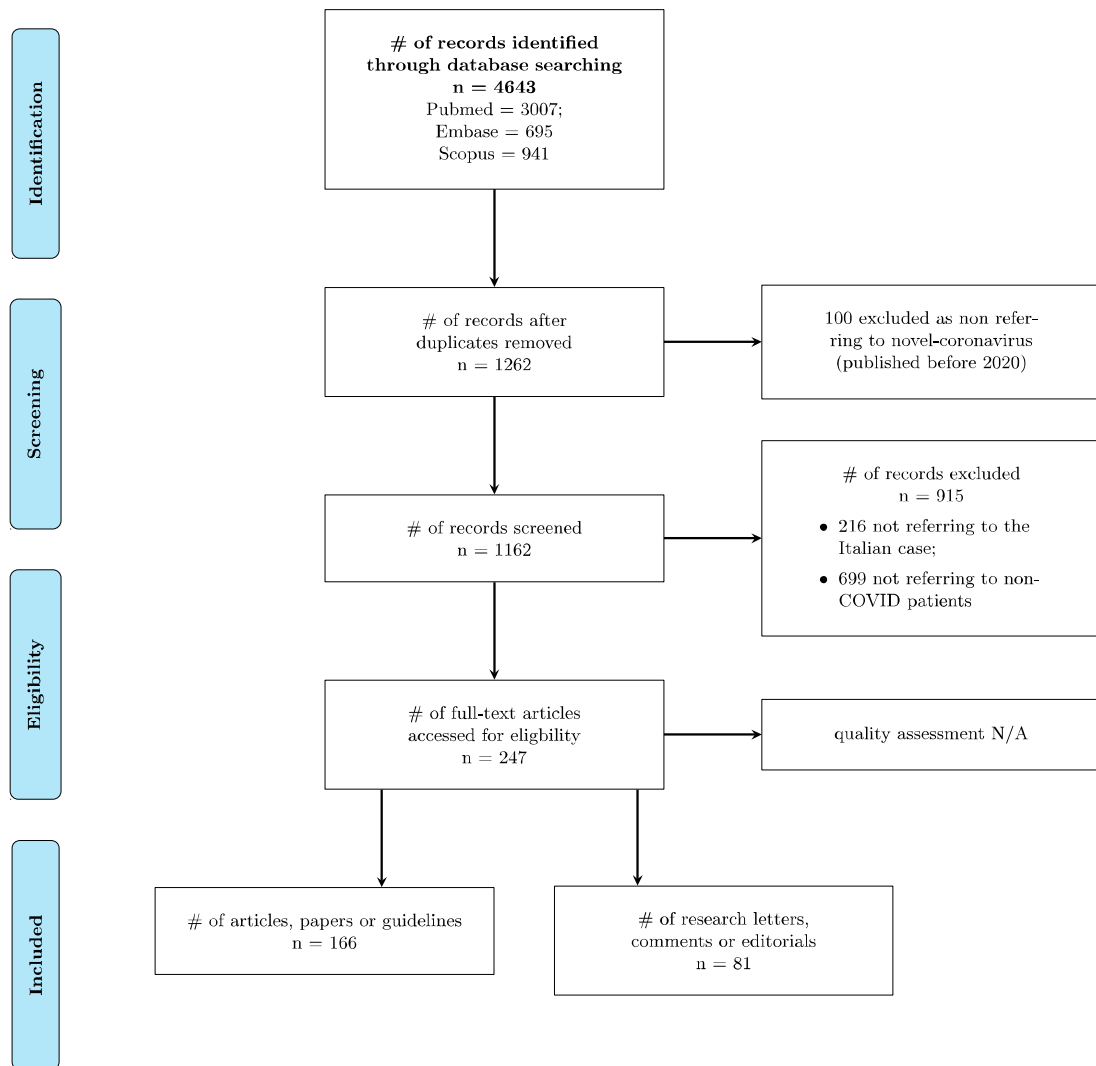

158

159 **Results**

160

161 The results are shown in Figure 1. After searching the databases, we identified a
162 total of 2957 papers, from three different databases. Database merges and the
163 removal of duplicate resulted in 1262 records, of which 100 were immediately
164 removed as they were not related to COVID-19 (articles published before the
165 pandemic in Italy). A total of 1162 records were then screened: 166 were removed
166 as not relevant to Italy; 534 were removed as they referred to COVID-19 patients
167 rather than non-COVID-19 patients. A total number of 247 were deemed eligible
168 (listed in Table 2, Supplementary Material), of which 81 consisted of
169 comments/letters/opinions/editorials.

170 Oncology and radiotherapy were the most represented category (47 papers),
171 followed by surgery (24 for general surgery, 9 for neurosurgery, 2 for cardio-surgery,

172

173 **Figure 1.** PRISMA flow diagram of study inclusion in the review.

174

175 2 for vascular surgery, and 3 further types), cardiology (19) and dermatology 14.

176 There was one paper each for rheumatology and microbiology.

177 Overall, 133 papers were related to clinical disciplines, 89 to surgery, and 24 to

178 services. In terms of the geographical distribution, many papers provided general

179 recommendations without a specific geographical identification (75). Lombardy was

180 the most represented region (72), followed by Lazio (21) and Emilia Romagna (15).

181 In the south, Campania was the most represented region (11), followed by Puglia

182 (4). Marche, Piedmont and FVG had 7 papers each, Tuscany and Veneto 9 each.

183 Overall, 73 were general/nationwide, 105 pertained to northern regions, 54 to central

184 regions and 15 to southern regions and islands. A total of 50 papers included

185 quantitative data that compared the pre- and post-lockdown periods on one side (18)
186 and the corresponding months of 2019 and 2020 on the other side (32). Specifically,
187 we found 8 papers presenting percentages of variation in the hospitalization rate, 27
188 in the clinical activity, 13 in the consultation/office and follow-up visits, 7 in the
189 mortality, 6 in the diagnostic/testing procedures and 12 in the treatment delivery. Due
190 to difficulties in merging these heterogenous data, herein we limited to discuss the
191 most relevant ones.

192

193 **Discussion**

194

195 On 11 March 2020, the World Health Organisation (WHO) declared COVID-19 to be
196 a pandemic.¹ However, Italy was already in lockdown, with decrees aimed at limiting
197 mobility and strengthening the National Health System. On March 9, 2020⁷, most
198 outpatient services were temporarily suspended, except for a few treatments that
199 were considered urgent and non-deferrable. Clinical support for early isolation,
200 treatment, and, where needed, intensive care of COVID-19 patients (or suspect
201 cases) became the priority, with a massive allocation of dedicated resources.

202 A large increase in all-cause mortality was revealed during the epidemic, greater
203 than the number of deaths attributed to COVID-19 cases. The possible causes of
204 this increase include the large number of severe undiagnosed COVID-19 cases, the
205 reduced access to health services due to the disruption of normal working processes
206 or due to the fear of contamination of sick patients affected by other diseases, and
207 possibly other factors.⁸

208 Here we provide a snapshot, across all medical specialties, of how the provision of
209 treatments to non-COVID patients in Italy has been impacted by the shortage of
210 resources imposed by the pandemic.

211

212 *Management of emergencies*

213 In general, non-COVID patients admitted to emergency departments (ED) decreased
214 and remained well below the standard levels⁹⁻¹¹. The youngest age classes declined
215 dramatically, whilst the oldest age classes progressively increased, remaining
216 considerably above the standard rate of the local ED.¹²

217 In northern Italy, the emergency gradually took over most of cardiology intensive
218 care units (ICUs).¹³ As expected, the net effect of this reorganization was a

219 significant reduction in sites and staff committed to the treatment of cardiovascular
220 diseases.^{14–18} Comparing out-of-hospital cardiac arrests in the same period of the
221 previous year, Baldi *et al.* found that the median arrival time of the emergency
222 medical service was three minutes longer in 2020, and the proportion of patients who
223 received cardiopulmonary resuscitation from bystanders was 15.6% lower. Among
224 patients in whom resuscitation was attempted by emergency medical services, the
225 incidence of out-of-hospital death was 14.9% higher in 2020 than in 2019.⁹ This
226 finding was confirmed by additional studies highlighting an unpredictable decrease in
227 acute coronary syndrome-related hospitalization in high-volume centres^{10,19,20,21} and
228 pacemaker implantation during the weeks following the COVID-19 outbreak.^{21–25}
229 Of note, one study showed a 49% reduction in acute heart failure admission to
230 hospital.²⁶ The patients admitted had longer door-to-balloon and symptoms to PCI
231 times, higher hs-cTnl levels at presentation, lower residual LV function at discharge,
232 and higher predicted late cardiovascular mortality on the GRACE score.¹⁹
233 A lower number of patients with minor strokes and TIAs, longer onset-to-door and
234 door-to-treatment times for major strokes, and reduced number of transfers from
235 spokes centres were also reported.^{11,27} As a result, the number of patients who
236 underwent intravenous thrombolysis or bridging therapy (combined intravenous and
237 thrombectomy) decreased by –□26% and –30%, respectively.
238 In addition, as a consequence of the reduction in the patient eligibility for bridging
239 therapy, the number of primary thrombectomies (performed with all the necessary
240 personal protective equipment owing to the risk of infection²⁸) increased by 41%.
241 Most of these patients had very serious strokes that would have benefited from early
242 diagnoses.¹¹
243 The decrease in hospital admissions, confirmed by a survey across multiple
244 countries including Italy^{29,30}, resulted in increased door-to-needle times and
245 therapeutic windows being missed for patients suffering from severe strokes.³¹ More
246 studies are needed to confirm these data and to evaluate the impact on death rates;
247 however, recent reports from other countries seem to confirm this trend.^{32,33}
248 The reduction in available ICU beds, massively dedicated to COVID-19 patients with
249 acute respiratory failure, and the fear of infection resulted in the shrinkage of surgical
250 activities in all fields^{34–38} and a reduction in urgent endoscopic procedures in COVID-
251 free hospitals.³⁹

252 Each sub-specialty defined various non- deferrable surgical procedures that had to
253 be guaranteed, causing a drop in consultations requested by emergency
254 departments as in the case of urgent urology.⁴⁰ The surgical community were also
255 faced with a shortage of blood components, derived from fewer donations due to
256 lockdown and fear of infection.⁴¹ To compensate for the initial fall (–10%) in blood
257 donations in the first week of March, the government promoted a national media
258 campaign on the importance and safety of blood donation as a priority to maintain
259 basic healthcare services for non-COVID patients.⁴² No blood-transmitted SARS-
260 CoV-2 infection has been reported to date.⁴³

261 Children's emergency departments also showed a substantial decrease in visits.⁴⁴
262 This might reflect the scarcity of resources or the reluctance of parents and health
263 care workers to expose children to the risk of viral infection in a health-care setting,
264 in addition to lower rates of acute infections and trauma.⁴⁵ However, this
265 phenomenon has been detrimental to the health of non-COVID child patients: 12
266 cases of delayed access to hospital care were reported during the week March 23–
267 27 across five hospitals of an Italian Children's Hospital Research Network. Half of
268 the children were admitted to an ICU and four died, highlighting the high risk of
269 delaying access to hospital care.⁴⁶ As a result, life-threatening conditions (i.e.
270 abdominal pain, severe ketoacidosis) seemed to be more frequent, requiring in some
271 cases an aggressive approach.⁴⁵

272 The same phenomenon affected dermatology⁴⁷. Tartari et al. compared two different
273 weeks, before and after the outbreak of the COVID-19 pandemic in Italy, showing a
274 decrease in unjustified referrals (93% reduction) in dermatological emergency
275 services.⁴⁸

276 Despite medical care for emergencies and urgent treatments being continuously
277 provided throughout the pandemic, the lack of personnel, resources, and ICUs beds
278 along with the patients' fear of being infected in hospital affected patient
279 management and substantially delayed the provision of ordinary medical activities.
280 These initial data seem to show a decrease in emergencies and an increase in
281 mortality. We strongly suggest undertaking detailed studies to further explore this
282 phenomenon.

283

284 *Management of non-deferrable conditions: the hub-and-spoke system*

285 To tackle the massive impact of the overflow of SARS-CoV-2 infected patients,
286 hospitals in Italy had to undergo a significant reorganization.^{49–54} In order to manage
287 conditions needing non-deferrable treatment while avoiding the risk of infection, hub-
288 and-spoke centres were created and widely used throughout the country.^{50,55–58} In
289 the hub-and-spoke model, a main campus or hub supplies the most intensive
290 medical services, while satellite campuses or spokes offer more limited services at
291 sites distributed across the neighbouring area.⁵⁹

292 Neurological surgery was particularly affected by the ICU reorganization, as it often
293 requires a period of intensive monitoring in ICUs.^{22,60–62} All the cases of elective
294 neurological surgery were deferred, while urgent neurosurgical pathologies (above
295 all traumas) and non-deferrable tumour cases were transferred to hubs.^{27,29–33,61,67,68}

296 A specific urgency classification for tumour cases was developed based on
297 symptoms, radiological findings, and suspected malignancy of the lesion.^{22,60,65,66}

298 Some minimal activities were still performed at spoke centres, only for very critical
299 cases or when specific tools were required (i.e. gamma knife treatment of neoplastic
300 lesions).^{22,60,62,69}

301 This provided an unprecedented opportunity for transversal collaboration among
302 different teams, representing real innovation in such a competitive setting.^{58,64}

303 A hub-and-spoke system was also organized for vascular surgery and cardiac
304 surgery units. All elective surgery was reduced and urgent surgery (including aortic
305 aneurysms, valvular diseases or severe coronary diseases) was performed only in
306 hub centres, preferring the endovascular to the open surgical approach whenever
307 possible.^{70–72} A transcatheter approach was generally preferred, as it usually does
308 not require an ICU bed or a ventilator.⁷¹

309 The limitation of all non-urgent surgical activities also applied to general surgery^{73–78}
310 and obstetrics.^{79,80} In highly-infected areas (such as Lombardy), hub centres were
311 created⁸¹ to treat only advanced symptomatic tumours^{81–83}, while elective
312 oncological surgery procedures continued to be performed in less affected
313 regions.^{81,84} This was an important issue for oncological patients, especially older
314 ones.^{85–88}

315 Many possible ways of minimizing the risks were proposed: to postpone treatments
316 or elective surgery for stable cancer in endemic areas, to provide patients with
317 greater personal protection, and to offer more intensive surveillance or
318 treatment.^{89–91} For example, neoadjuvant treatments were recommended or

319 increased⁹² to defer surgical admission for as long as possible.^{81,84,92,93} For other
320 medical conditions requiring surgery under particular circumstances, such as relapse
321 of inflammatory bowel disease, dedicated hubs were identified.^{94–96}
322 Interestingly, a tendency toward treatments aimed at reducing hospitalization was
323 also found in medical oncology.^{97,98}
324 Some regions such as Tuscany created protocols for home care in order to avoid
325 exposure to hospital settings.⁹⁹ Oncological care delivery and cancer diagnosis^{100–102}
326 were dramatically reduced by the SARS-CoV-2 outbreak, even though suboptimal
327 care and treatments may result in worse cancer-related outcomes. Oncologists were
328 thus asked to preserve the continuum of care of patients, while adopting mitigation
329 strategies to reduce the likelihood of infection in all cancer patients.^{103–112}
330 Arduino et al. described a worrying delay in the diagnosis of oral cancer in north-
331 west Italy during the Covid pandemic.¹¹³ Moreover, the cessation of elective
332 activities, screening programs¹¹⁴, and the drastic reduction in services regarding
333 breast cancer restricted evaluations to only clinical observations of palpable lesions
334 with the elevated risk of missing new diagnoses.¹¹⁵ Although not requiring a
335 structural reorganization, palliative care was forced to find a new balance between
336 family member visits and patients' needs.^{116–119}
337 In orthopaedics, the reorganization led to the identification of poly-specialist major
338 trauma centres and specialistic referral centres for minor trauma or non-deferrable
339 orthopedic surgeries (i.e. septic arthritis or malignant tumours).^{120–127} There was a
340 reduction in the number of proximal femur fractures in two centres¹²⁸, as well as a
341 reduction in hip and knee arthroplasties.¹²⁹
342 A similar re-organization was also carried out for plastic surgery: only post-traumatic,
343 oncological and burn treatments were guaranteed.^{130–132} A new approach based on
344 enzymatic debridement was proposed for burns in order to reduce the need for burn
345 surgery.¹³³
346 In urology, only urgent, non-deferrable procedures (colicky flank pain, gross
347 hematuria and acute urinary retention) were authorized after careful multidisciplinary
348 evaluation,^{134–138} which led to a drop in urological surgical activities.¹³⁹ Whenever
349 possible, alternative treatments not requiring general anaesthesia (i.e. radiotherapy
350 for genitourinary cancers) were suggested as being preferable.^{134,136,140}

351 Oral and maxillofacial surgery¹⁴¹, otolaryngology^{142,143} and ophthalmology^{144–147} also
352 suspended all non-urgent treatments, especially considering the high risk of infection
353 of healthcare workers while manipulating the upper airways and eyes.¹⁴⁸ Only the
354 treatment of trauma, malignant neoplasms, and severe infections was
355 guaranteed.^{142,149–152}

356 In the context of radiotherapy, all follow-up visits involved a phone call in advance in
357 order to postpone non-urgent cases.^{153–156} The initial consultations of patients
358 needing treatment for malignant tumours were conducted as normal^{157–159}, as were
359 certain treatments such as bone metastase radiotherapy.¹⁶⁰ Specific approaches,
360 such as short fractionated radiotherapy, were suggested.¹⁶¹

361 All non-urgent and deferrable radiation treatments were delayed, while therapies for
362 patients with a better prognosis (benign and functional diseases) were
363 postponed.^{162,163}

364 Dermatology departments were also involved in an extensive reorganization.^{164,165}
365 Dermatological anti-neoplastic treatments were provided in the dermatology clinics
366 of many centres, such as Bologna¹⁶⁶, Naples¹⁶⁷, Modena¹⁶⁸ and Ancona¹⁶⁹, which
367 also maintained urgent dermatological procedures and consultations required by
368 other hospital wards. As awareness of the severity of the COVID-19 increased, some
369 patients were concerned about continuing their medications, however all centres
370 followed specific recommendations and advised patients not to suspend these drugs
371 without consultation.^{170–173}

372 Lastly, microbiology labs underwent unprecedentedly high workloads with the
373 increasing number of samples (swabs or serological tests) to analyze for the
374 identification of Sar-Cov-2 infection. An extensive reorganization of the microbiology
375 lab activities thus also occurred. In a large teaching hospital in Rome, the
376 introduction of night shifts and the creation of a dedicated team significantly
377 improved the number of samples processed, without interfering with the daily
378 laboratory routines.¹⁷⁴

379 Hub-and-spoke centres represented an important change in care provision,
380 especially in the most affected regions involving almost all specialties. However, data
381 on the efficacy of this reorganization, measured in terms of health outcomes (such
382 as mortality) are lacking. To date, only a few reports^{100,102,113} suggest a tendency
383 toward a decrease in diagnosis for non-deferrable conditions despite the hub-and-

384 spoke organization. Further epidemiological studies are needed to verify the
385 emerging picture and to evaluate the impact on mortality rates.

386

387 *Replacement therapies: dialysis and transplantation*

388 Dialysis units experienced a profound change in their management, with the
389 introduction of COVID-19 isolation rooms and the identification of dedicated
390 healthcare professionals.^{175,176} Rombolà et al. proposed three actions to be taken in
391 order to dialyze non-COVID patients safely: hygiene measures, the use of PPE to
392 protect patients and the healthcare team, and the protection of the dialysis ward with
393 an isolated area for testing patients suspected of infection.¹⁷⁷

394 In general, all transplant programs were profoundly affected by the pandemic.^{178–180}

395 First of all, the wall-to-wall screening of donors and recipients was established in
396 order to identify positive patients that would not be able to donate or receive blood, in
397 view of the high mortality rates of COVID-19 in immunocompromised patients.^{78,180–}

398 ¹⁸³ Secondly, the widespread reduction in available ICU beds led to an estimated
399 15% drop in transplants compared with the average of the last five years¹⁸⁴, such as
400 liver transplantations.¹⁸⁰ Transplantation was thus suggested only in true end-stage
401 organ failure, preferring conservative treatments (maximizing pharmacological
402 therapy) in all other patients.^{184,185,187}

403

404 *Management of deferrable conditions and telemedicine*

405 The management of chronic conditions also suffered.¹⁸⁸ Cesari et al. found that the
406 integration of care services collapsed: admissions to post-acute/long-term care
407 facilities were reduced and several person-tailored interventions were suspended –
408 e.g., physical therapists for mobilization.¹⁸⁶ Lasevoli et al. reinforced the view that the
409 current pandemic has had dramatic consequences for the mental health of serious
410 psychiatric patients.¹⁸⁹ All this inevitably led to a drastic reduction and a substantial
411 reorganization of the clinical activity in many specialties¹⁹⁰, postponing elective
412 treatments and switching to telemedicine (TM)¹⁹¹ for consultation in most cases.

413 TM consists in the distribution of health-related services and information via
414 telecommunication technologies and represents an elective approach to managing
415 deferrable conditions during the COVID-19 pandemic in Italy. Almost all specialties
416 benefited from TM during the pandemic. In many cases, the short-term results have

417 been particularly encouraging, although a longer follow-up is needed to assess the
418 efficacy of these measures. The results are summarized in Table 1.

419 TM has deeply influenced non-COVID patient care, enabling the remote diagnosis
420 and monitoring of patients and allowing clinical data sharing between patients and
421 physicians. However, the long-term effects on common health outcomes need to be
422 carefully studied.^{192,193} Avoiding face-to-face contact via TM has been one of the
423 most effective measures to limit the spread of SARS-Cov-2 infection, although many
424 issues have been raised, such as privacy management and the lack of clear
425 guidelines.^{194–198}

426 Table 1. Management of deferrable conditions and telemedicine during COVID-19 pandemic in Italy.
427

Specialty	Conditions managed with a TM approach	Additional sources of recommendations	Comment
Pneumology ¹⁹⁹	None reported	Italian Pediatric Respiratory Society	For deferrable pneumological conditions, routine tests such as pulmonary functioning test (PFT) were limited to the necessary, namely spirometry
Cardiology ^{200,201}	1) Cardiac Rehabilitation (CR) 2) Heart failure (HF)	Position Paper of the AICPR (Italian Association of Clinical Cardiology, Prevention and Rehabilitation)	1) The creation of a network for home CR for post-surgery and post-acute coronary syndrome patients including telecardiology systems was recommended. 2) Positive impact of telemedicine on HF outcome
Gastroenterology ^{95,202–206}	1) Intestinal Bowel Diseases (IBD) 2) Celiac Disease	International Organization for the Study of IBD	1) Postponing of biological therapy not recommended (risk of IBD relapse). Tapering of chronic corticosteroids suggested. No short-term clinical impact was observed in those who postponed biologics (up to 10%). 2) Positive impact of remote consultation for celiac diseases patients
Oncology ^{207–213}	1) Screening for cancer treatment 2) Breast cancer; bone metastasis; sarcoma	Italian Association of Radiotherapy and Clinical Oncology (AIRO)	1) Case-by-case risk/benefit evaluation for patients with cancer eligible for specific tailored treatment 2) Patients with condition stable enough that services can be delayed for the duration of the COVID-19 pandemic and/or the intervention is nonpriority based on the magnitude of benefit (e.g., no survival gain with no change or reduced QoL). Follow-up visits managed remotely
Immunology and allergology ^{214–217}	1) Orticaria; allergic asthma; vasculitis; systemic sclerosis 2) Primary antibody deficiencies	Italian Society of Rheumatology (SIR)	1) Self-administration at home of some biologicals; switch to subcutaneous therapy or local referral for those who could not postpone their treatments 2) Health Related Quality of Life (HRQOL) was similar in patients forced to shift from hospital-based to home-based immunoglobulin treatment and in patients who continued their usual home-based replacement
Reproductive medicine (andrology, medically assisted reproduction therapy, IVF) ^{218–224}	1) Sexual male problems (like Peyronie's disease or erectile dysfunction). 2) In vitro fertilization	Italian Society of Andrology (SIA) Position statement of the	1) Postponing of new treatments not considered urgent. 2) Maintenance of cryogenic banks to prevent infection of stored tissues

	(IVF)	Italian Society of Andrology and Sexual Medicine (SIAMS)	
Neurology ²²⁴⁻²³⁰	Chronic migraine;immune-mediated neuropathies;amyotrophic Lateral Sclerosis;Parkinson's disease;lysosome storage diseases	Italian Society of Neurology (SIN) Italian Society of Clinical Neurophysiology (SINC)	Patients were remotely treated with both pharmacological and, where useful, behavioral therapies.
Endocrinology ²³¹⁻²³³	Diabetes mellitus type I		Maintaining a safe in-home physical activity considered a good strategy. No deterioration of glucose control was observed but an improvement (more stable rhythms of life and more regular meals time) The hybrid closed loop (HCL) system allowed physicians to download detailed data during the tele-consulting through a web-based program.
Dermatology ²³⁴⁻²³⁶	Chronic inflammatory skin disease (psoriasis, hidradenitis suppurativa, atopic-dermatitis, acne, autoimmune skin conditions)		Automatic renewal of the biologics prescriptions Remote monitoring was effective in preventing unnecessary worsening of severe chronic skin diseases and poor outcomes due to withdrawal of current therapy
Psichiatria ²³⁷⁻²⁴²	Perinatal depression;eating disorders;psychiatry for older people;adult neuropsychiatry;adult autism		Patients benefited from telemedicine activities and remote psychosocial interventions
Pediatrics ²⁴³⁻²⁴⁶	1)Follow-up visits of cancer patients Allergic and immunological diseases;benign haematological diseases;inherited metabolic diseases	Consensus statement of the Italian society of pediatric allergy and immunology for the pragmatic management of children and adolescents with allergic or immunological diseases during the COVID-19 pandemic	1)Access to pediatric onco-haematologic was delayed for patients in continuation therapy and for long-term cancer patients in follow-up after elective chemotherapy. Verbal psychological support and anxiety containment in one-to-one phone calls reinforced by training in relaxation and breathing techniques.
Surgery ^{247,248}	Outpatient clinic activity (proctology)	SAGES Recommendation Regarding Surgical Response to COVID-19 Crisis	TM assured continuous assistance to patients who recently underwent surgery. Where possible, postponing surgical interventions while maximizing pharmacological therapy has been the main strategy described in general surgery
Orthopedics ²⁴⁹	Foot-ankle orthopedic surgery		Taking clinical photos, recording a video of the wound/condition. Photograph or scanning important documents.
Neurosurgery ²⁵⁰	Brain tumours		Management of brain tumours is deferred after evaluation of clinical symptoms, size and locations, neuroimaging features.
Obstetrics and gynecology ^{250,251}	Pregnant women		Advices provided to patients with suspected infection. The referral to a private obstetrician/gynecologist or a community midwife has been suggested to avoid hospital attendance of pregnant women
Urology ^{252,253}	Prostate cancer		Medical therapies for advanced hormone sensitive or castration resistant prostate cancer continued.

Rehabilitation ^{254–258}	-	Official document of the Italian PRM Society (SIMFER)	Positive impact: satisfaction of patients, families, and professionals

Conclusions

439

440

One limitation of this systematic review is the heterogeneity in publication type, which prevented the execution of a meta-analysis to summarize the findings together with a quality assessment. Another important issue is the potential underreporting, although the studies did cover experiences from the whole country.

441

442

443

444

445

446

447

448

449

Our work thus suggests that a public health crisis has resulted from the pandemic, a concern raised in other countries too, such as France.²⁵⁹ More detailed, population-based studies are needed to assess whether emergency management benefited from the reorganization adopted. Nevertheless, the hub-and-spoke system and telemedicine undoubtedly played – and continue to play – a crucial role in dealing with non-deferrable and deferrable conditions, respectively.

457

458

459

460

461

462

463 **Research in context**

464

465 **Evidence before this study**

466 Although Italy is one of the countries most affected by the SARS-Cov-2 pandemic,
467 the impact of the profound healthcare reorganization on non-COVID-19 patient
468 management remains unclear. No comprehensive reports are available to assess
469 the effect of the pandemic on this. However, many papers and comments have
470 been published, each representing a valuable source of data regarding non-
471 COVID-19 patient care at the time of the COVID-19 pandemic.

472

473 **Added value of this study**

474 This is the first study providing a comprehensive view of the direct and indirect
475 effects of the COVID-19 pandemic on the management of non-COVID-19 patients
476 in Italy. We review the evidence of XXX studies focusing on changes in the
477 management of emergencies, non-deferrable and deferrable conditions, and how
478 the pandemic led to the implementation of hub and spoke systems and
479 telemedicine.

480 By systematically summarizing the evidence from the selected studies despite their
481 heterogeneity, this review comprehensively shows a decrease in emergency
482 department access, an increase in mortality for some time-dependent conditions, a
483 profound change in the management of non-deferrable conditions, and a strong
484 stimulus for the adoption of telemedicine tools.

485

486 **Implication of all the available evidence**

487 As the pandemic is spreading globally, this study stimulates further research on
488 non-COVID-19 patient management. According to the findings of the current
489 review, health strategies aimed at COVID-19 care need to be carefully analyzed
490 and adequate measures of their impact on non-COVID-19 patients need to be
491 assessed. Additional studies could provide valuable information on how the
492 COVID-19 pandemic has influenced emergencies, and non-deferrable and
493 deferrable conditions.

494

495

496 **Contributions**

497 T.P. and G.L. conceived and designed the study. T.P. collected the data. G.L,
498 M.M.O, An.B, G.A., Al.B. analyzed and selected the data. F.C. and T.P. supervised
499 data analysis. G.L, M.M.O., An.B, G.A., Al.B., T.P., wrote the manuscript. M.M.O.
500 and An.B. revised and edited the manuscript. L.Z. and P.R. revised the final version
501 of manuscript.

502
