Abstract

Background: Nature-based social prescribing programmes such as ‘bluespace prescription’ may promote public health and health improvement of individuals with long-term conditions. However, there is limited systematically synthesised evidence that investigates the contexts and mechanisms of Bluespace Prescription Programmes (BPPs) that could inform programme theories for policy and practice.

Methods: We conducted a realist review by searching six databases for articles published between January 2000 and February 2020, in English, about health and social care professionals providing referral to or prescription of blue space activities with health-related outcomes. We developed themes of contextual factors by analysing the contexts of BPPs. We used these contextual factors to develop programme theories describing the mechanisms of BPP implementation. Our study was registered with PROSPERO (CRD42020170660).

Results: Fifteen studies with adequate to strong quality were included from 6,736 records. Service users had improvements on their physical, mental, social health, and environmental knowledge after participating in BPPs referred to or prescribed by health and social care professionals. Patient-related contextual factors were referral information, free equipment and transportation, social support, blue space environments, and skills of service providers. Programme-related contextual factors were communication, multi-stakeholder collaboration, financing, and adequate service providers. Programme theories on patient enrolment, engagement, adherence, communication protocols, and long-term programme sustainability described the mechanisms of BPP implementation.

Conclusion: BPPs could support health and social care services if contextual factors and mechanisms of programme theories associated with patients and programme delivery are considered for implementation. Our findings have implications in planning, development, and implementation of similar nature-based social prescribing programmes in health and social care settings.

Keywords: sustainable healthcare; social prescribing; blue spaces; bluespace prescriptions

UNPUBLISHED PRE-PRINT (NOT PEER-REVIEWED)

Introduction

Social prescribing (SP) is a health and social care approach that promotes health by connecting individuals to community-based and non-medical programmes providing physical activity and social support (Teuton, 2015; Husk et al., 2020). SP is delivered through four referral pathways: 1) signposting; 2) direct referral; 3) link worker, and 4) holistic link worker (Husk et al., 2020). The process commonly starts with a consultation with a healthcare worker (general practitioner/GP). If GPs give information through leaflets and direct patients to community-based organisations (CBOs) or service providers, this is referred to as signposting. Direct referral is when GPs contact CBOs and arrange patient enrolment. The link worker pathway comprises GPs connecting patients to link workers who arrange patient enrolment. The holistic link worker pathway includes a feedback loop between CBOs and link workers (Husk et al., 2020). Moreover, SP implementation is described by programme theories (Husk et al., 2020; Pawson et al., 2005; Rycroft-Malone et al., 2012) on patient enrolment (first successful referral), engagement (attendance to first session), adherence (maintained participation over time), link worker coordination (communication), and partnerships with CBOs (supportive interventions) (Husk et al., 2020; Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018). SP could help motivate individuals to engage in health-promoting behaviours such as physical activity, socialisation, and self-management (Husk et al., 2020; Bickerdike et al., 2017; Bertotti et al., 2018). It could also help reduce primary healthcare burden by depressurising healthcare professionals' workload through promotion of non-clinical interventions (Bertotti et al., 2018).

Nature-based social prescribing or nature prescription is a type of SP that promotes health and wellbeing through contact with nature (Husk et al., 2020; Leavell et al., 2019). Exposure to nature can improve physical and mental health (Hartig et al., 2014), and the presence of blue spaces, defined as natural and manmade outdoor surface water environments,

enhances these effects (Pouso et al., 2021; Benton et al., 2021; Völker and Kistemann, 2011). Contact with blue spaces are associated with health outcomes as illustrated by the ‘Blue Space and Health/Wellbeing Model’ (White et al., 2020). Exposure to blue spaces in terms of duration, frequency, and intensity is associated with individuals’ contact with blue spaces which could be indirect (window view), incidental (commute along a river path), or intentional (beach visit) (White et al., 2020; Keniger et al., 2013). Contact with blue spaces improves health outcomes through mitigation (noise abatement), instoration (physical activity), and restoration (stress reduction) pathways (White et al., 2020; Markevych et al., 2017), resulting in improved mood, self-esteem, physical activity, social interactions, and decrease in mortality (Georgiou et al., 2021; Tiegues et al., 2020; Finlay et al., 2015). These pathways are associated with environmental (type, quality, weather) or personal (age, gender, ethnicity) effect modifiers influencing engagement with blue space activities (BSAs) (White et al., 2020). The exposure–outcome pathway is catalysed by feedback actions such as quality improvement (societal) and safe access (local) to blue spaces (White et al., 2020). It also includes personal actions such as nature-based social prescribing (Blue Gyms and prescribing therapeutic BSAs) that targets individuals’ motivations to have contact with blue spaces (White et al., 2020; Depledge and Bird, 2009; Britton et al., 2020).

The knowledge base on social prescribing falls behind the fast growth and roll-out of social prescribing programmes on the ground (Husk et al., 2020). There is limited understanding on the contextual implementation of specific types of SP (Husk et al., 2020) including nature-based social prescribing programmes the utilise blue spaces. There is also an evidence gap on the effectiveness (Bickerdike et al., 2017; Chatterjee et al., 2018; Pescheny et al., 2018), suitability (Pilkington et al., 2017), referral processes (Chatterjee et al., 2018), and factors influencing SP uptake (Britton et al., 2020; Buckley and Brough, 2017). Additionally, existing systematic reviews on social prescribing mainly focused on general and greenspace

programmes (Husk et al., 2020; Bertotti et al., 2018; Masterton et al., 2020). Considering these gaps and the growing evidence on the health benefits of blue spaces, we conducted a realist review to investigate the contexts and mechanisms of implementing Bluespace Prescription Programmes (BPPs) delivered to people with health conditions. We used realist synthesis (Pawson et al., 2005) to investigate the contextual factors influencing BPP implementation (Pawson et al., 2005; Rycroft-Malone et al., 2012) and used these contextual factors to develop programme theories describing the mechanisms of BPP implementation.

Methods

Our systematic realist review followed the PRISMA guidelines (Page et al., 2021) and realist reviews (Berg, 2016). A realist review is way of evidence synthesis that provides explanation why interventions work or do not work in certain circumstances by interrogating the contextual complexities and mechanisms of implementing such interventions (Rycroft-Malone, 2012). The steps of a realist review are: 1) identifying the question; 2) clarifying the purpose of the review; 3) finding and articulating the initial programme theories; 4) searching for evidence; 5) appraising the evidence; 6) extracting the data; 7) synthesising findings; and 8) drawing conclusions and recommendations (Berg, 2016).

Identifying the question and clarifying the purpose of the review

We defined BPP as individual or group activities that take place in or around natural water environments such as surfing, swimming, running near blue spaces, amongst others (interventions), which are referred to or prescribed by health and social care professionals (population or participants) through SP referral pathways and with health-related outcomes (outcomes) (Husk et al., 2020). We included peer-reviewed research on BPPs conducted in natural water environments which were referred to or prescribed by health and social care workers (GPs, pharmacists, social workers, link workers, etc.) to individuals attending health

and social care facilities and with health-related outcomes. We included case reports, qualitative, case-control, cohort, pre-post intervention studies, non-randomised, and randomised controlled trials published in English. We limited the publication period from January 2000 to February 2020 since research on the health benefits of blue spaces emerged in the early 2000s (Völker and Kistemann, 2011; Britton et al., 2020). We excluded studies where non-health or non-social care workers referred BSAs to participants through advertisements and studies in which BSAs were not conducted in natural water environments.

Finding and articulating the initial programme theories

Our search and data analysis were guided by the following initial social prescribing programme theories (PTs):

Initial PT1: If referral is presented in an acceptable manner, it is compatible with the patient's needs and expectations, and the patient believes that it will improve their condition, then they may enrol (enrolment) (Husk et al., 2020).

Initial PT2: If transportation is provided making the socially prescribed activity accessible to the patient, then they will engage (engagement) (Husk et al., 2020).

Initial PT3: If the service providers are skilled and there are improvements on patient's condition, then they are more likely to keep attending (adherence) (Husk et al., 2020).

Initial PT4: If there are link workers facilitating delivery of social prescriptions and liaising with health and social care facilities and third sector organisations, then the referral uptake will be successful (link worker coordination) (Husk et al., 2020; Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018).

Initial PT5: If partnership between health and social care facilities and community-based organisations is financially supported, then the delivery of social prescribing programmes will be sustained (partnership with CBOs) (Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018).

Searching for evidence

We searched PubMed, Web of Science, PsycInfo, MEDLINE, Scopus, and CINAHL using keyword strings (Appendix 1) and conducted snowball search by screening the reference lists of included studies (Schardt et al., 2007; Jalali and Wohlin, 2012). Records were uploaded, de-duplicated, and screened using Rayyan QCRI (Ouzzani et al., 2016). Title, abstract (JA, KH, SCh, and 17 researchers), and full-text screenings (JA–KH, JA–SCh) were independently conducted in pairs. KNI resolved conflicting decisions.

Appraising the evidence

Included studies were categorised based on their methodological approaches to suit the QualSyst tools (Kmet et al., 2004). Quality of studies was independently assessed in pairs (JA–KH, JA–SCh, JA–KNI). Conflicting ratings were reconciled by one-to-one discussion. We adopted strong (≥ 0.80), good (0.71–0.79), adequate (0.51–0.70), and limited (≤ 0.50) quality thresholds for quantitative papers (Lee et al., 2008) and used adequate (≥ 0.55) and low (≤ 0.54) for qualitative studies (Maharaj and Harding, 2016). Quantitative and qualitative components of mixed method studies were assessed separately (Kmet et al., 2004; Maharaj and Harding, 2016).

Extracting the data

JA electronically extracted the names of authors, publication year, methodological approaches, participants, location, prescriber/referrers, referral pathways, facilities, intervention format, BSA type, facilitators, barriers, timescale/duration, dose/frequency, health

conditions, and outcomes. Extracted data were inputted in a bespoke data collection form using Microsoft Excel.

Synthesising the findings

We employed realist synthesis to analyse and synthesise extracted data (Pawson et al., 2005; Rycroft-Malone et al., 2012) about the facilitators, barriers, and descriptions of BPPs and how were they implemented. Using hybrid coding in NVivo 12 (Fereday and Muir-Cochrane, 2006), JA developed themes of contextual factors associated with BPP implementation. These contextual factors were used to develop the context-mechanism-outcome configurations elaborated by ‘if-then’ statements for the development of programme theories describing the mechanism of BPP implementation (Pawson et al., 2005; Rycroft-Malone et al., 2012; Pawson and Bellamy, 2006; Thomas and Harden, 2008). We developed programme theories for BPP implementation by refining the five initial social prescribing programme theories on patient enrolment, engagement, adherence, link worker coordination, and partnership with CBOs (Husk et al., 2020; Rycroft-Malone et al., 2012; Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018; Pawson and Bellamy, 2006). The developed themes of contextual factors and programme theories for BPP implementation were consulted and validated by JA in a series of virtual meetings and presentations with KH, KNI, SCh; members of the research advisory team (RH, SP, SCu); and other stakeholders from the Hydro Nation Forum, the policy governing body of the Hydro Nation Scholars Programme, which is the funding organisation of this research. The themes of contextual factors and programme theories were refined and finalised based on the comments from these consultations.

Our study was registered with PROSPERO (CRD42020170660).

Results

Search results

We collected 6,736 records from the database and snowball search (Figure 1). We excluded 3,814 duplicates before screening and 2,483 reports due to irrelevancy at title and abstract screening stage. We excluded 136 and 288 reports from database and citation searches, respectively, at full-text screening stage (Appendix 2).

Figure 1. Study selection

Quality assessment results

We included 15 studies. Four quantitative studies had strong (Razani et al., 2018; Rogers et al., 2014; Vella et al., 2013; Maund et al., 2019), two had good (Godfrey et al., 2015; James et al., 2017), and three had adequate quality (de Matos et al., 2017; Hignett et al., 2017; Cavanaugh and Rademacher, 2014). Seven qualitative studies had adequate quality (Maund et al., 2019; White et al., 2016; Lopes, 2015; Bennett et al., 2014; Dustin et al., 2011; Fleischmann et al., 2011; Mowatt and Bennett, 2011). Quantitative papers were downgraded due to

strategies on controlling confounders and reporting variance estimates. Qualitative papers were downgraded because of data collection, verification, and reflexivity procedures (Table 1) (Agarwal et al., 2013).

Since realist reviews require contextual configurations to describe mechanisms of programme implementation, we did not exclude studies which had below average quality results (Pawson et al., 2005; Rycroft-Malone et al., 2012).

UNPUBLISHED PRE-PRINT (NOT PEER-REVIEWED)

Characteristics of included studies

Eight studies were conducted in the USA (Razani et al., 2018; de Matos et al., 2017; Bennett et al., 2014; Rogers et al., 2014; Vella et al., 2013; Dustin et al., 2011; Fleischmann et al., 2011; Mowatt and Bennett, 2011), five studies in the UK (Maund et al., 2019; Godfrey et al., 2015; Hignett et al., 2017; Cavanaugh and Rademacher, 2014; White et al., 2016), and two in Portugal (de Matos et al., 2017; Lopes, 2015) (Table 2). Eight hundred three (803) service users aged between 2 and 85 years participated in the studies, of which 197 were veterans aged between 21 and 50 years. BSAs were referred to or prescribed by health, social care, and health-trained teachers. The prescription or referral was provided in healthcare (Razani et al., 2018; Rogers et al., 2014; Vella et al., 2013; Godfrey et al., 2015; James et al., 2017; White et al., 2016; Bennett et al., 2014; Dustin et al., 2011; Fleischmann et al., 2011; Mowatt and Bennett, 2011), social care (Maund et al., 2019; Godfrey et al., 2015; James et al., 2017; de Matos et al., 2017; White et al., 2016), and specialised educational facilities (Godfrey et al., 2015; Hignett et al., 2017; Cavanaugh and Rademacher, 2014) using SP referral pathways (Husk et al., 2020). In one study, all three facilities provided the referral or prescription (Godfrey et al., 2015).

Blue space activities prescribed in healthcare facilities

Ten studies were in military hospitals, GP practices, paediatric, and rehabilitation clinics (Razani et al., 2018; Rogers et al., 2014; Vella et al., 2013; Godfrey et al., 2015; James et al., 2017; White et al., 2016; Bennett et al., 2014; Dustin et al., 2011; Fleischmann et al., 2011; Mowatt and Bennett, 2011). Veterans with hearing impairment, anxiety, depression, TBI, and PTSD were prescribed with fly-fishing by recreational therapists through signposting or direct referral (Vella et al., 2013; Bennett et al., 2014; Mowatt and Bennett, 2011). Veterans with PTSD were directly referred to a combination of running, boating, kayaking, and paddling by a team of recreational therapist, nurse, psychologist, and social worker (Dustin et al., 2011). Some veterans with PTSD (Rogers et al., 2014) and children who were obese, had sensory

problems, depression, anxiety, and PTSD (Godfrey et al., 2015) were prescribed with surfing by physicians (Rogers et al., 2014) or a team of GPs, nurses, and psychologists (Godfrey et al., 2015) through direct referral or holistic link worker. Socioeconomically deprived and ethnically diverse children with obesity, loneliness, and poor mental health were prescribed with play at a beach (Razani et al., 2018; James et al., 2017) by pediatricians using holistic link worker (James et al., 2017) or a combination of signposting and link worker pathways (Razani et al., 2018). Patients who experienced substance abuse were directly referred to sailing by substance abuse specialists (White et al., 2016). Participants had improvements in mood and emotions (Razani et al., 2018; White et al., 2016), better sleep quality (Vella et al., 2013), self-efficacy (White et al., 2016; Bennett et al., 2014; Mowatt and Bennett, 2011), reduced substance intake (White et al., 2016; Dustin et al., 2011), decreased stress and PTSD symptomatology (Rogers et al., 2014; Vella et al., 2013), and increased relaxation (Razani et al., 2018; Vella et al., 2013; Mowatt and Bennett, 2011). Some felt less depressed, anxious, and lonely (Razani et al., 2018) whilst others felt improvements in their mobility (Fleischmann et al., 2011), physical activity (Razani et al., 2018; James et al., 2017), and body weight (James et al., 2017). Others had improved social skills and increased contact with nature (Razani et al., 2018).

Blue space activities prescribed in social care facilities

Four studies were in social care institution, foster care homes, and community wellbeing centre (Maund et al., 2019; Godfrey et al., 2015; de Matos et al., 2017; Lopes, 2015). Young people and adults with mobility and sensory impairment (Lopes, 2015), psychosocial problems, anxiety, and depression were directly referred to surfing by either a team of social worker and therapist (Lopes, 2015); social worker and adolescent educators (de Matos et al., 2017); or social child support specialist (Godfrey et al., 2015; de Matos et al., 2017; Lopes, 2015). Adults and elderly patients with anxiety and depression were referred to guided river

walks, bird and otter watching, and canoeing by mental health workers through a link worker pathway (Maund et al., 2019). Participants improved daily functioning, self-esteem (Godfrey et al., 2015), fitness, physical activity (Godfrey et al., 2015; de Matos et al., 2017), mental and emotional wellbeing (Godfrey et al., 2015; de Matos et al., 2017), interpersonal competencies (Godfrey et al., 2015; de Matos et al., 2017; Lopes, 2015), and environmental knowledge (Lopes, 2015).

Blue space activities prescribed in specialised educational institutions

Three studies were in specialised educational facilities and pupil referral units (Godfrey et al., 2015; Hignett et al., 2017; Cavanaugh and Rademacher, 2014). Young people with behavioural problems, ASD, depression, anxiety, and sensory problems were referred to surfing by psychologists, health-trained educators, or social and child support specialists using direct referral or holistic link worker pathways (Godfrey et al., 2015; Hignett et al., 2017; Cavanaugh and Rademacher, 2014). Participants had improvements in their attitude (Hignett et al., 2017), self-esteem (Godfrey et al., 2015), physical fitness (Godfrey et al., 2015; Hignett et al., 2017), mental and emotional wellbeing (Hignett et al., 2017), social competence (Godfrey et al., 2015; Hignett et al., 2017; Cavanaugh and Rademacher, 2014), and ecological knowledge (Hignett et al., 2017).

Table 2. Characteristics of included studies and corresponding pre-existing social prescribing programme theories

Authors, Year, Country	Prescriber or referrer	Referral pathway	Facility providing prescription or referral	Type of blue space activity	Programme format	Timescale	Frequency and duration	Service users	Health and wellbeing status	Health, wellbeing, and other outcomes
Bennett et al., 2014, USA	Recreational therapist	Signposting	Veteran hospital	Fly-fishing	Structured fly-fishing, stretching, and breathing exercises, campfire, and games	4 days	4 sessions, 4 hours each	28 veterans, aged 22-50 years	PTSD, TBI, and hearing impairment	Self-confidence, social reconnection, overcoming fears
Cavanaugh and Rademacher, 2014, UK	Psychologist	Holistic link worker	Specialised school	Surfing	Structured pre-post surf camp, family socials, group activities, two-day surf camp (i.e., arts and crafts, frame decoration, paddle relay, sandcastle building, and t-shirt signing)	7 weeks (estimated)	7 sessions (estimated), unspecified duration	11 student campers, aged 10-16 years	ASD	Social competence (assertion, responsibility, and engagement); social skills (ownership of behaviour)
de Matos et al., 2017, Portugal	Social worker and adolescent educators	Direct referral	Foster care homes	Surfing	Structured group surfing and psycho-educational activities	3 months (estimated)	8 sessions, 4 hours each	48 adolescents, aged 10-16 years	Psychosocial problem and vulnerability	Perseverance, problem solving, time management, social competencies, interpersonal relationship, emotional regulation, improved peer interaction, surfing skills, and sea safety
Dustin et al., 2011, USA	Therapeutic recreation specialist, nurse, psychologist, social worker	Direct referral	Veteran hospital	Combined river running, kayaking, and paddling	Structured boating (floating), hiking, campfire, and socials	4 days	Whole day camping for 4 days	13 veterans, unspecified age	PTSD	Reduced PTSD symptomology
Fleischmann et al., 2011, USA	Exercise physiologist	Holistic link worker	Veteran hospital	Surfing	Structured group surf therapy and yoga for strength training, balance rehabilitation, and hydrotherapy	6 months	24 sessions, 3 hours each	One adult, aged 21 years	Polytrauma, TBI, and mild depression	Improved mobility (walking, balancing, vestibular function, muscular strength, aerobic endurance); relief from TBI; reduced narcotic intake
Godfrey et al., 2015, UK	GP, nurse, psychologist; and social and child support service specialist	Direct referral	GP surgery, educational facility, and social care institution	Surfing	Structured group surfing	6 weeks	6 sessions, unspecified duration	121 young people, aged 8-18 years	Depression, anxiety, social exclusion, obesity, and sensory problems	Robust positive functioning, self-esteem, emotional wellbeing, vitality, friendship and social trust, fitness, and physical activity

Hignett et al., 2017, UK	Teachers trained in assessing social, emotional, and behavioural status of children using a tool developed by the local council	Direct referral	Short stay schools or pupil referral units	Surfing	Structured surfing and environmental awareness activities (e.g., beach cleaning)	12 weeks	Unspecified	58 young people, aged 13-16 years	Aggressive behaviours, social, emotional, and behavioural problems	Physical fitness (drop in resting heart rate); personal and interpersonal wellbeing; social connectedness; positive attitude; and environmental awareness and knowledge
James et al., 2017, USA	Paediatrician	Holistic link worker	Community health clinic/centre	Play activities	Unstructured physical activities outdoors (e.g., nature walks, unstructured playtime at the beach)	Unspecified	Weekly sessions, unspecified duration	Unspecified number of children, aged 2-13 years	Overweight and obesity	Physical activity and weight loss
Lopes, 2015, Portugal ⁴⁵	Therapist and social worker	Direct referral	Rehabilitation centres and foster care homes	Surfing	Structured adapted surfing encompassing activities of daily living, education, work, play and leisure, and social participation	1 year	10 surfing sessions, unspecified duration	321 children and adults, aged 8-66 years	Mobility and visual impairment, cognitive disabilities	Social skills and inclusion, mental wellbeing, physical activity, and health and environmental awareness
Maund et al., 2009, UK	Mental health support worker	Link worker	Community wellbeing service	Combined nature and river walk, bird and otter watching, and canoeing	Structured guided nature walks, introduction to wetland reserve, feeding and identifying bird species, canoeing, and free time in nature	6 weeks	6 sessions, unspecified duration	16 adults, aged 65-85 years	Anxiety and depression	Improved mental and physical health; and social inclusion
Mowatt and Bennett, 2011, USA	Recreational therapist	Signposting	Veteran hospital	Fly-fishing	Unstructured fly-fishing	2 days	Whole day for 2 days	67 veterans, unspecified age	PTSD	Being at the present state, relaxed, and retrospective reconciliation
Razani et al., 2018, USA	Paediatrician	Signposting and link worker	Primary care clinic	Play activities	Mix of independent and supported park prescription (e.g., group nature outings and play activities at the bayfront and lake)	3 weeks	Unspecified	78 children, average age of 8-8 years	Poor mental health, loneliness, and psychological stress	Decrease in stress, improvement in loneliness and physical activity, nature affinity and frequent park visit
Rogers et al., 2014, USA	Physician	Holistic link worker	Primary care clinic	Surfing	Structured one-to-one surfing lesson and collaborative socialisation	5 weeks	5 sessions, 4 hours each	14 veterans, aged 24-30 years	PTSD and depression	Lower PTSD symptom severity
Vella et al., 2013, USA	Recreational therapist	Direct referral	Veteran hospital	Fly-fishing	Structured fly-fishing, socials, games, and entertainment	2 days	4 sessions, 4 hours each	74 veterans, unspecified age	PTSD, TBI, major depressive disorder, and anxiety	Sustained reduction in symptoms of depression, anxiety, and somatic stress; increased sleep quality and efficiency; improvement in

										mood profiles (e.g., attentiveness, serenity, self-assuredness, joviality, positive affect); and decreased feelings of guilt, hostility, fear, sadness, and negative affect
White et al., 2016, UK	Medical professionals specialising in drug and alcohol dependency	Direct referral	Rehabilitation clinic	Sailing	Structured day-to-day sailing functions and group activities and socialisation (e.g., hosting sails, lifting anchors, cooking, cleaning, navigation, steering, keeping watch, and attending social meetings)	5 days	Whole day for 5 days	11 adults, aged 26-61 years	Alcohol and drug use	Self-insight, perseverance, and inner strength; social skills; increased confidence; abstinence to substance abuse; and positive future framing

PTSD–post traumatic stress disorder; TBI–traumatic brain injury; ASD–autism spectrum disorder; GP–general practitioner

Contextual factors and programmes theories describing the mechanisms of BPP implementation

The patterns of contextual factors (CFs) associated with the implementation of BPPs are either patient-related or programme-related. In total, we identified 20 patient and programme-related contextual factors (Table 3). The patient-related contextual factors are presentation of information on prescription or referral (CF1), patient perceptions of blue space activities (CF2), programme format (activity, timescale, frequency, duration) (CF3), accessibility (provision of transportation, equipment, other logistics) (CF4), compatibility of blue space activities to patient needs (CF5), social environment (CF6), blue space environment (CF7), skilled service providers (CF8), values of service providers (CF9), social support (CF10), and health, wellbeing, and other personal improvements of service users (CF11). The programme-related contextual factors are: coordination between link workers, service providers, and health and social care facilities (CF12), patient-to-link worker communication (CF13), patient-to-healthcare provider communication (CF14), patient-to-service provider communication (CF15), patient-to-patient communication (16),

patient-to-carer communication (CF17), organisational support (staff and volunteers) (CF18), stakeholder support (CF19), and funding and policy support (CF20).

Table 3. Themes of contextual factors associated with BPP implementation and initial social prescribing programme theories

Source study	Identified contextual factors (CFs)	No. of initial social prescribing programme theories (PTs) supported by the study
Bennett et al., 2014	Programme format (activity, timescale, frequency, and duration) (CF3) Accessibility (provision of transportation, equipment, and other logistics) (CF4) Compatibility of blue space activities to patient needs (CF5) Social environment (CF6) Blue space environment (CF7) Values of service providers (CF9) Social support (CF10) Health, wellbeing, and other personal improvements of service users (CF11) Organisational support (staff and volunteers) (CF18) Funding and policy support (CF20)	1,2,3,5

The combinations of 20 patient and programme-related contextual factors informed the development of programme theories describing the mechanisms of BPP implementation (Pawson et al., 2005; Rycroft-Malone et al., 2012; Pawson and Bellamy, 2006). Table 4 presents how the different contextual factors informed the development of final programme theories for BPP implementation based on the initial social prescribing programme theories.

Table 4. Final programme theories for BPP implementation using the identified contextual factors

Initial Social Prescribing Programme Theories (PTs) supported by included studies	Context	Setting	Contextual Factors (CF)	Final Programme Theories describing the mechanisms of implementing Bluespace Prescribing Programmes based on initial social prescribing programme theories
<p>Initial PT1: Patient enrolment</p> <p><i>If referral is presented in an acceptable manner, it is compatible with patient's need and expectations, and the patient believes that it will improve their condition, then they may enrol (Husk et al., 2020).</i></p>	<p>People with physical and/or mental health conditions seek health and social care services</p>	<p>Health or social care facilities</p>	<p>CF1 Presentation of information on prescription or referral</p> <p>CF2 Patient perceptions of blue space activities</p> <p>CF3 Programme format (activities, timescale, frequency, and duration)</p>	<p>Final PT1: Patient enrolment to blue prescription programmes</p> <p><i>If service users' apprehensions and optimism are positively influenced by information on BPPs provided by prescribers, then they may enrol.</i></p>

<p>Initial PT3: Patient adherence</p> <p><i>If the service providers are skilled and there are improvements on patient's condition, then they are more likely to keep attending (Husk et al., 2020).</i></p>	<p>People with physical and/or mental health condition engaging with community-based blue space activities</p>	<p>Community-based organisation providing blue prescription programmes</p>	<p>CF8 Skilled service providers</p> <p>CF9 Values of service providers</p> <p>CF10 Social support</p> <p>CF11 Health, wellbeing, and other personal improvements of service users</p>	<p>Final PT3: Patient adherence to blue prescription programmes</p> <p><i>If service users experience social support and health improvement through blue space activities delivered by knowledgeable and skilled service providers, then they may adhere.</i></p>

<p>Initial PT4: Link worker coordination</p> <p><i>If there are link workers facilitating delivery of social prescriptions and liaising with health and social care facilities and third sector organisations, then the referral uptake will be successful (Husk et al., 2020; Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018).</i></p>	<p>People with physical and/or mental health conditions seek health and social care (some were accompanied by their carers)</p>	<p>Health or social care facilities and community-based organisations</p>	<p>CF12 Coordination between link workers, service providers, and health and social care facilities</p> <p>CF13 Patient-to-link worker communication</p> <p>CF14 Patient-to-healthcare provider communication</p> <p>CF15 Patient-to-service provider communication</p> <p>CF16 Patient-to-patient communication</p> <p>CF17 Patient-to-carer communication</p>	<p>Final PT4: Visibility of blue prescription programmes in health and social care facilities and successful prescription supported by communication protocols</p> <p><i>If communication protocols are in place between service users, prescribers, link workers, and service providers, then BPPs may be more visible and successfully implemented in health and social care facilities.</i></p>
<p>Initial PT5: Partnership with community-based organisations</p> <p><i>If partnership between health and social care facilities and community-based organisations is financially supported, then the delivery of social prescribing programmes will be sustained (Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018).</i></p>	<p>People with physical and/or mental health conditions seek health and social care (some are accompanied by their carers)</p>	<p>Health or social care facilities and community-based organisations</p>	<p>CF18 Organisational support (staff and volunteers)</p> <p>CF19 Stakeholder support</p> <p>CF20 Funding and policy support</p>	<p>Final PT5: Long-term programme sustainability of blue prescription programmes</p> <p><i>If BPPs are supported by organisational, stakeholder, funding, and policy interventions, then these are more likely to be sustainably implemented.</i></p>

Figure 2 illustrates the delivery of BPP in health and social care settings and at what stage or component of the implementation where each programme theory is associated.

Figure 2. Context and mechanism of prescribing blue space activities in health, social care, and specialised educational facilities

Final Programme Theory 1: If service users' apprehensions and optimism are positively influenced by information on BPPs provided by prescribers, then they may enrol.

Figure 3. Contextual configurations for patient enrolment programme theory

Some service users were optimistic towards BPPs, whilst others had apprehensions (Rogers et al., 2014; Lopes, 2015). The novelty of BPPs, unfamiliar environments, and patient's lack of experience generated fear and anxiety (Lopes, 2015). Knowledge sharing through counselling using information about the type, structure, and benefits of BPPs, coupled with maps, pedometers, and activity guides informed patients' decisions to enrol (Razani et al., 2018; James et al., 2017). Patients' enrolment was guided by written prescriptions and initiated contact by link workers (James et al., 2017). Some healthcare workers raised concerns about filling out paper prescriptions being time-consuming and suggested integrating prescriptions of BSAs in the electronic prescribing system (James et al., 2017). Structured BSAs followed programmes of activities (Rogers et al., 2014; Vella et al., 2013; Maund et al., 2019; Godfrey et al., 2015; James et al., 2017; de Matos et al., 2017; Hignett et al., 2017; Bennett et al., 2014) whilst others were provided in an unstructured manner (Razani et al., 2018; James et al., 2017; Mowatt and Bennett, 2011). BPPs were provided as stay-in which required free meals and lodging (Vella et al., 2013; Hignett et al., 2017; Bennett et al., 2014; Dustin et al., 2011; Mowatt and Bennett, 2011), or stay-out (Razani et al., 2018; Rogers et al., 2014; Maund et al., 2019; Godfrey et al., 2015; James et al., 2017; White et al., 2016; Lopes, 2015; Fleischmann et al., 2011).

Final Programme Theory 2: If service users are provided with free logistics, equipment, and transportation to access a socially supportive and client-centred blue space activity and environment, then they may engage.

Figure 4. Contextual configurations for patient engagement programme theory

Patient engagement was associated with patient preference, skills, and psychosocial fulfilment after initial sessions (Godfrey et al., 2015; Hignett et al., 2017). Consulting people with disabilities about the design of safety and supportive infrastructure making the environment accessible and adaptive to their needs enabled engagement (Lopes, 2015; Bennett et al., 2014). Service users had strong interests in BPPs because these were free (James et al., 2017). However, some BPPs (surfing, canoeing, kayaking) required costly equipment, especially for economically deprived service users. Providing equipment, transportation, and camping fees encouraged engagement especially for activities in distant locations (Razani et al., 2018; Rogers et al., 2014; Vella et al., 2013; Maund et al., 2019; Godfrey et al., 2015; James et al., 2017; Bennett et al., 2014). Travelling in groups to new places also relieved anxious participants (Maund et al., 2019). Wildlife and natural blue space or water environments

facilitated relaxing experiences, distraction, engagement of human senses, self-strength, and acclimatisation (Vella et al., 2013; Maund et al., 2019; White et al., 2016; Bennett et al., 2014; Dustin et al., 2011). Weather was an environmental effect modifier (White et al., 2020; Hignett et al., 2017).

Final Programme Theory 3: If service users experience social support and health improvement through blue space activities delivered by knowledgeable and skilled service providers, then they may adhere.

Figure 5. Contextual configurations for patient adherence programme theory

Skilled service providers ensured standardised programme delivery using regularly evaluated guidelines (Hignett et al., 2017). Service providers were also trained on working with clients with disabilities (proper use of surfing boards for children with ASD) (Cavanaugh and Rademacher, 2014; Lopes, 2015). Positive values of service providers were appreciated by participants (Razani et al., 2018; Rogers et al., 2014; Maund et al., 2019; Hignett et al., 2017; White et al., 2016; Lopes, 2015; Bennett et al., 2014). Encouragement, enthusiasm, and positive reinforcement through constructive observations created a friendly atmosphere and empowered participants to explore new activities (Razani et al., 2018; Rogers et al., 2014;

Maund et al., 2019; White et al., 2016; Lopes, 2015). Staff responsiveness facilitated connection with participants (Mowatt and Bennett, 2011) through open communications (Razani et al., 2018). This was perceived by clients as genuine care and willingness to help (Rogers et al., 2014). Improvements in environmental awareness and knowledge (Hignett et al., 2017; Lopes, 2015), self-esteem (Rogers et al., 2014; Vella et al., 2013; Maund et al., 2019; Godfrey et al., 2015; Cavanaugh and Rademacher, 2014; White et al., 2016; Lopes, 2015), mental health (Razani et al., 2018; Rogers et al., 2014; Vella et al., 2013; Maund et al., 2019), physical health (Maund et al., 2019; Hignett et al., 2017; Fleischmann et al., 2011), social health (de Matos et al., 2017; Hignett et al., 2017; White et al., 2016), and reduced dependency on medicines (Dustin et al., 2011; Fleischmann et al., 2011) and addictive substances (White et al., 2016) were also associated with patient adherence.

Final Programme Theory 4: If communication protocols are in place between service users, prescribers, link workers, and service providers, then BPPs may be more visible and successfully implemented in health and social care facilities.

Figure 6. Contextual configuration for communication protocol programme theory

Different communication channels were used within and outside health and social care facilities. Initial presentation of BPPs to prescribers facilitated planning of referral processes, requirements, and responsibilities (James et al., 2017; de Matos et al., 2017). Electronic

communications provided feedback channels to discuss patients' health conditions (James et al., 2017). Champions or advocates of BPPs in health and social care settings acted as programme leads and maintained coordination and programme visibility in health and social care facilities (James et al., 2017). Inclusive communication between health and social care workers, patients, and service providers facilitated by link workers and considered patient-preferred mechanisms and related attributes (Razani et al., 2018; James et al., 2017; Mowatt and Bennett, 2011) were also associated with health improvements (Rogers et al., 2014). Communications between patients and carers provided spaces for awareness raising and socialisation (Lopes, 2015). Socialisation between patients through interest-based grouping and matching also contributed to self-improvement (Razani et al., 2018; Rogers et al., 2014; James et al., 2017; de Matos et al., 2017; Lopes, 2015; Mowatt and Bennett, 2011).

Final Programme Theory 5: If BPPs are supported by organisational, stakeholder, funding, and policy interventions, then these are more likely to be sustainably implemented.

Figure 7. Contextual configuration for long-term programme sustainability programme theory

Surfing was perceived as a beneficial health and social care intervention by health sector stakeholders, general public, and policymakers (Lopes, 2015). The health and social benefits of BPPs convinced funders, councils, and schools to support the programme (Hignett

et al., 2017), especially because the cost of therapeutic surfing (£50/session) was less than the mental healthcare cost for young people (£265/year) (de Matos et al., 2017; Knapp et al., 2011). However, this economic evaluation was not robust (de Matos et al., 2017). Many BPPs were created through health and CBO partnerships (James et al., 2017; Dustin et al., 2011). Other BPPs received financial support from funding institutions (Godfrey et al., 2015; Hignett et al., 2017). Shared resources covered many implementation aspects (e.g., meals, transportation, equipment) making BPPs accessible to service users (Godfrey et al., 2015; James et al., 2017; Hignett et al., 2017; Lopes, 2015; Bennett et al., 2014). Adequate skilled staff and volunteers were the backbones of BPPs. Client-provider ratio depended on participant intake, activities, and financial capacity (Maund et al., 2019; Godfrey et al., 2015; James et al., 2017; de Matos et al., 2017; Cavanaugh and Rademacher, 2014).

Discussion

Bluespace Prescription Programme (BPP) implemented in health and social care facilities contextualised by programme theories on patient enrolment, engagement, adherence, communication protocol, and programme sustainability had benefits on general, physical, mental, social health, and ecological knowledge of service users. These programme theories were shaped by configurations of contextual factors on patient needs and characteristics, accessibility, compatibility, social and blue space environments, skills and values of service providers, patient health improvement, communication, multi-stakeholder partnership, financing, and policy.

Outcomes investigated in this review are consistent with current evidence demonstrating that exposure to blue spaces has physical and mental health benefits (Völker and Kistemann, 2011; Gascon et al., 2017). Additionally, some BPPs had educational activities about the environment and these improved participants' knowledge about the value of blue

spaces and paved way for the development of pro-environmental behaviours (White et al., 2020). BPPs package the health-promoting impacts of blue spaces into structured health and social care programmes for those who could most benefit from these. From a behaviour change perspective (Michie et al., 2011), improving the quality and accessibility of blue spaces could provide greater opportunities for contact with these environments (White et al., 2020). However, these environmental modifications should be coupled with capability-building (knowledge sharing) and motivational strategies (social support) to promote and sustain contact with natural settings (Sharma et al., 2020), such as blue spaces.

BPPs target individuals' motivations to increase utilisation of blue spaces for physical or social activities (Depledge and Bird, 2009; Britton et al., 2020). However, BPPs might not be for everyone as environmental and personal circumstances are associated with engagement (White et al., 2020). Medicalisation of spending time in nature could be perceived as a medical order rather than a personal choice (Tester-Jones et al., 2020). Prescribing specific blue spaces could reduce patients' intrinsic motivation to visit nature, thus compromising its health benefits (Tester-Jones et al., 2020). Patient autonomy (Varkey, 2021) through a patient-centred approach using motivational interview should be considered in selecting BSAs which are compatible with patients' health and personal needs (Britten et al., 2000; Little et al., 2001; Cockburn and Pit, 1997). The investigated BPPs in this review had higher duration than the 120 minutes per week recommended dose of nature (White et al., 2019). However, duration could be a modifying factor for nature engagement (White et al., 2020). Duration of BPPs should be matched with patients' gender (Alejandre and Lynch, 2020; Vert et al., 2019; Elliott et al., 2018), age (Alejandre and Lynch, 2020; Garrett et al., 2019; Helbich et al., 2019; Dempsey et al., 2018), ethnicity (Leeworthy, 2001; Wolch and Zhang, 2004), and health conditions (Wood et al., 2016; Amoly et al., 2014). Increasing choices for BSAs such as dragon boating (Britton et al., 2020), recreational SCUBA diving (Dimmock, 2009), open water

swimming (van Tulleken et al., 2018; Huttunen et al., 2004), and cycling near blue spaces (Roberts et al., 2018; Mackay and Neill, 2010; Pretty et al., 2007) could promote inclusivity and attract enrolment and engagement of many individuals with different personal characteristics and health needs. Engagement with and adherence to BPPs could be facilitated by positive doctor-patient interaction because it promotes patient's self-confidence, motivation, and optimism (Ha and Longnecker, 2010). However, in one systematic review, only six studies had healthcare professionals prescribing BSAs (Britton et al., 2020). Some BSAs are prescribed by a team of health and social care workers with different backgrounds, specialisations, and expertise. Appropriateness training of prescribers is an SP barrier (Britton et al., 2020), thus, health and social care professionals with varied backgrounds and skill sets should be provided with needs-based and standardised trainings on delivery protocols.

Realist reviews on general social prescribing and greenspace programmes highlighted doctor-patient relationship, capacity of service providers, and supportive social environments as contextual factors to implementation (Husk et al., 2020; Masterton et al., 2020), these were also highlighted in our review. Additionally, communication protocols, stakeholder collaboration, and policy support are fundamental programme-related factors associated with programme continuity (Masterton et al., 2020; McHale et al., 2020). Communication protocols between prescribers, link workers, and service providers facilitated by written prescriptions were essential elements of the referral pathways (Husk et al., 2020). England's National Health Service backs the link worker-based model (NHS England, 2019) because link workers support healthcare delivery by facilitating resolutions for patient's health concerns (Husk et al., 2020; Bertotti et al., 2018) through motivational counselling and by coordinating referrals between prescribers, patients, and service providers (Bickerdike et al., 2017; Chatterjee et al., 2018; Bertotti et al., 2018). Moreover, written prescriptions increased likelihood of patient enrolment because these were perceived as alternative to pharmaceutical prescriptions (McHale et al.,

2020; Dempster et al., 2015). Many BPPs are also formed through health and stakeholder partnerships which are funding dependent. Unstable funding affects sustained SP organisation and delivery (Bertotti et al., 2018). There is also a perceived risk in data sharing between healthcare facilities and CBOs. Policies on institutionalising BPPs in government-funded health services and data sharing agreement between stakeholders are necessary. Moreover, medicalising ecosystem services of blue spaces could go against some ecological paradigms (Ofiara and Brown, 1999) within the scope of the environment sector. BSAs could cause disturbances to fish and other wildlife, human-induced pollution, and other irreversible ecosystem degradation (Maxwell et al., 2018; Burgin and Hardiman, 2011; Graham and Cooke, 2008; Davenport and Davenport, 2006). The ethical principles of beneficence and nonmaleficence (Varkey, 2021) should be extended for the protection of nature by involving healthcare specialists, environmentalists, patient groups, and blue space communities in planning and implementing BPPs that aims for the protection of patients and the environment.

In the context of the COVID-19 pandemic, the health-related use of outdoor environments increased during lockdowns (Hartig et al., 2014; Hubbard et al., 2021; Geng et al., 2021) suggesting that outdoor settings such as blue spaces helped people cope with stress (Heo et al., 2020). People in Scotland and Spain associated exposure to nature with mental health improvements and better sleep quality (Hartig et al., 2014; Corley et al., 2021). Contact with nature is associated with fewer mental and physical symptoms and may buffer the impacts of social isolation (Yang et al., 2021; Bratman et al., 2019; Van den Berg et al., 2015). BPPs could be used as an additional healthcare service to help the health sector meet increasing demands for mental healthcare. Link workers could facilitate BPPs through virtual health assessments and motivational interviewing (Razai et al., 2020). However, accessibility, safety, and financial concerns were also associated with less time and fewer visits in blue spaces (Astell-Burt and Feng, 2021) which should be considered and resolved. A siloed approach in

tackling the mental health epidemic compounded by lockdowns and social isolation will not work as we transition to a ‘better normal’ after the COVID-19 pandemic. Approaches should include strong collaboration between health, environment, urban planning, third sector, amongst others to share more resources toward integrating BPPs in primary healthcare with appropriate environmental-economic accounting (United Nations-Food and Agriculture Organisation, European Union, Organisation for Economic Co-operation and Development, and World Bank Group, 2014). These collaborations and resources should ensure that contextual factors influencing enrolment, engagement, and adherence to BPPs are addressed along with effective communication and programme continuity.

Strengths and limitations

We did not include grey literature and we only focused on BPPs prescribed in health and social care settings. Reports on BPPs in other facilities which are unpublished or not peer-reviewed could provide more information about other contextual factors and mechanisms of implementation. There were also limitations on the quality of individual studies. Many quantitative studies had quality issues on the strategies for controlling confounders and reporting variance estimates, whilst qualitative papers had issues on strategies for data collection, verification, and reflexivity.

Certain limitations are also anchored in employing a realist review. Realist synthesis is interpretative and subjective in nature (Masterton et al., 2020), especially in interpreting how contextual factors inform the development of programme theories. We ensured to remove this subjectivity bias by validating the results of the analysis during a series of stakeholders’ meetings and consultation with a multidisciplinary set of co-authors that informed the finalisation of the programme theories for BPP implementation. We were also limited on the available information about the contexts and mechanisms of each bluespace prescription

programme in each study, especially when there is no detailed information about the intervention.

Geographical homogeneity was also a limitation. Some studies had participants from different ethnicities and sociodemographic backgrounds, but all studies were conducted in the Global North. Nonetheless, our study offers pragmatic recommendations for policy development supporting BPP implementation in different contexts. In the context of Global South countries, it is important to be cognisant of the political and social constructs surrounding blue space accessibility and the readiness of health systems for large-scale BPP implementation. Nevertheless, universal healthcare reforms in developing countries could leverage the groundwork on BPP integration in health promotion strategies to deliver the vision of healthy, liveable, and sustainable environments for all.

Research directions

We suggest the conduct of intervention studies examining the intersection of BPPs, physical, and mental health as cost-effective programmes. Implementation research and pilot studies are needed to establish the ‘proof of concept’ of BPPs as a viable public health intervention for scaling-up and institutionalisation in national and local health and social care systems. Causation and long-term implications of BPPs on population health, healthcare delivery, and the environment should be investigated through randomised controlled trials and longitudinal studies.

Conclusion

In summary, this realist review demonstrates that health, social care, and health-trained professionals working in health, social care, and specialised educational facilities provided referral to or prescription of BSAs. Service users of BPPs were veterans, adults, older people, and children who experienced physical and mental health conditions, social isolation,

addiction, and/or behavioural issues. BPPs improved the physical, mental, and social health, as well as environmental knowledge of service users. The implementation of BPPs is associated with 20 unique patient and programme-related contextual factors on patient needs and characteristics, accessibility, compatibility, social and blue space environments, skills and values of service providers, patient health improvement, communication, multi-stakeholder partnership, financing, and policy. The configurations of these contextual factors informed the refinement of pre-existing social prescribing programme theories for the development of programme theories of BPPs. If implementation of accessible and patient centred BPPs is sustainably supported by multi-stakeholder partnerships, funding, policy interventions, effective communication protocols, skilled health and social care workers and service providers, then service users are more likely to enrol in, engage with, adhere to, and have improvements to health and environmental knowledge after the programme. Contextual factors and programme theories of investigated BPPs could inform development and implementation of similar nature-based social prescribing programmes in other contexts. BPPs could be an additional health and social care service that promote exposure to blue spaces for public health promotion and health improvement of individuals with multiple and long-term health conditions. With inaccessibility, long waiting list, adverse effects, incompatibility, cost, and environmental impacts of conventional healthcare, integrating patient centred and sustainable BPPs into a suite of healthcare services is beneficial.

Funding: This systematic review was funded by the Scottish Government Hydro Nation Scholars Programme.

Appendix 2. List of studies excluded at full-text screening stage with brief reasons

Code No.	Article title	Decision
1	Interagency physical activity and lifestyle education programmes.	Wrong intervention
2	Metabolic monitoring training program implementation in the community setting was associated with improved monitoring in second-generation antipsychotic-treated children.	Wrong intervention
3	'Missing Pieces'-Functional, Social, and Environmental Barriers to Recovery for Vulnerable Older Adults Transitioning from Hospital to Home.	Wrong context
4	Non-medical prescribing and mental health nursing: prominent issues.	Wrong intervention
5	Review: Exercise therapy reduces fatigue in chronic fatigue syndrome.	Wrong research design
6	A review of the clinical evidence for exercise in osteoarthritis of the hip and knee	Wrong research design
7	Determinants of restorative experiences in everyday favorite places	Wrong context
8	Exercise Therapy for Fibromyalgia	Wrong research design
9	Cognitive therapy of depression: Pretreatment patient predictors of outcome	Wrong intervention
10	Neighborhood Environment and Adherence to a Walking Intervention in African American Women	Wrong intervention
11	Consumer responses towards non-prescription and prescription drug advertising in the US and Germany	Wrong intervention
12	Determinants of adherence to exercise in women treated for breast cancer	Wrong intervention
13	Adherence to exercise referral schemes by participants - what do providers and commissioners need to know? A systematic review of barriers and facilitators	Wrong research design
14	Mental health and functional impairment outcomes following a 6-week intensive treatment programme for UK military veterans with post-traumatic stress disorder (PTSD): a naturalistic study to explore dropout and health outcomes at follow-up	Wrong intervention
15	Use of complementary medicinal therapies in West Pomerania: a population-based study	Wrong research design
16	Is brisk walking an adequate aerobic training stimulus for cardiac patients?	Wrong intervention
17	Caregiver perceptions of a fruit and vegetable prescription programme for low-income paediatric patients	Wrong intervention
18	What we know, what we do not know, and where are we heading? Efficacy and acceptability of psychological interventions for depression	Wrong intervention
19	Community Fitness Center-Based Physical Activity Interventions: A Brief Review	Wrong intervention
20	Personalized exercise training in chronic lung diseases	Wrong research design
21	Is Exercise the Right Medicine for Dystrophic Muscle?	Wrong population
22	An Emerging Paradigm for the UNESCO Global Geoparks: The Ecosystem's Health Provision	Wrong context
23	Leisure athletes at risk of medical complications: outcomes of pre-participation screening among 15,778 endurance runners - SAFER VII	Wrong intervention
24	Sex differences in asthma in swimmers and tennis players	Wrong intervention
25	Improving health status through physical activity for individuals with chronic pulmonary diseases	Wrong intervention
26	Non-pharmacological rehabilitation interventions for concussion in children: a scoping review	Wrong intervention
27	Urban Greening and Its Role in Fostering Human Well-Being	Wrong research design
28	Improving the physical health of people prescribed antipsychotic medication in secondary care mental health provider services. AQUA's approach to providing health improvement support in North West England	Wrong intervention
29	Improve Physical Health Indicators and Create a Platform for Exercise Prescription	Not retrieved
30	A higher effort-based paradigm in physical activity and exercise for public health: making the case for a greater emphasis on resistance training.	Wrong intervention
31	Exercise therapy for chronic fatigue syndrome.	Wrong research design
32	Reduced Contact Cognitive-Behavioral Interventions for Adult Depression: A Review.	Wrong intervention
33	Morita Therapy to Treat Depression: When and How to Encourage Patients to Join Activities	Wrong context

34	Safely active mobility for urban baby boomers: The role of neighborhood design.	Wrong intervention
35	The social network as a health support strategy for hypertensive patients	Wrong intervention
36	Clinical and therapeutic characterization of a Portuguese sample of patients with schizophrenia.	Wrong intervention
37	Exploiting system fluctuations. Differential training in physical prevention and rehabilitation programs for health and exercise	Wrong intervention
38	Physiotherapeutic interventions on an outpatient basis for orthopaedic and trauma surgery: can success be recorded?	Wrong intervention
39	Effects of Mindfulness-Based Stress Reduction on employees' mental health: A systematic review	Wrong research design
40	Patients' and therapists' experiences with a new treatment programme for eating disorders that combines physical exercise and dietary therapy: the PED-t trial. A qualitative study protocol	Wrong intervention
41	Basic strategies of cognitive behavioral therapy	Wrong intervention
42	Effectiveness of psychosocial and spiritual interventions in the management of depression	Wrong intervention
43	Randomized Evaluation of Cognitive-Behavioral Therapy and Graded Exercise Therapy for Post-Cancer Fatigue	Wrong intervention
44	Dementia care in general practice. What can the BEACH survey tell us?	Wrong intervention
45	Understanding the effects of the neighbourhood built environment on public health with open data	Wrong intervention
46	Service-users' perspectives of link worker social prescribing: A qualitative follow-up study	Wrong intervention
47	Relationship between exposure to the natural environment and recovery from hip or knee arthroplasty: A New Zealand retrospective cohort study	Wrong intervention
48	Targeting lifestyle energy expenditure in the management of obesity and health: from biology to built environment	Wrong intervention
49	Prescribing physical activity in parks to improve health and wellbeing: Protocol of the park prescription randomized controlled trial	Wrong intervention
50	What approaches to social prescribing work, for whom, and in what circumstances? A protocol for a realist review	Wrong research design
51	"Swimming against the tide" restricting prescribing practices in a prison: A personal journey	Wrong intervention
52	'At-risk' places: Inequities in the distribution of environmental stressors and prescription rates of mental health medications in Glasgow, Scotland	Wrong intervention
53	Policy prescriptions for healthier communities	Wrong intervention
54	Walking for well-being: are group walks in certain types of natural environments better for well-being than group walks in urban environments?.	Wrong intervention
55	Combining self-help and professional help to minimize barriers to physical activity in persons with multiple sclerosis: a trial of the "Blue Prescription" approach in New Zealand.	Wrong intervention
56	Aquatics, health-promoting self-care behaviours and adults with brain injuries.	Wrong intervention
57	Social prescribing in cardiology: rediscovering the nature within us	Wrong intervention
58	Blue Prescription: A single-subject design intervention to enable physical activity for people with stroke.	Wrong intervention
59	Body Mass, Metabolic and Cardiovascular Impact of Aquatic Aerobic Exercise and Nutritional Guidance for Individuals with Chronic Incomplete Spinal Cord Injury (CMISCI)...Aquatic Physical Therapy Section Platforms Presented at APTA's 2017 Combined Sections Meeting in San Antonio, Texas	Wrong intervention
60	Differential effects of water-based exercise on the cognitive function in independent elderly adults.	Wrong intervention
61	Effects of water- and land-based exercise programmes on women experiencing pregnancy-related pelvic girdle pain: a randomized controlled feasibility study	Wrong intervention
62	Exploring the Blue Prescription intervention to promote physical activity in people with long-term conditions	Wrong intervention
63	Shifting Gears: Engaging Nurse Practitioners in Prescribing Time Outdoors	Wrong intervention
64	Social Prescribing: Primary care patient and service user engagement	Wrong intervention
65	The health benefits of the great outdoors: A systematic review and meta- analysis of greenspace exposure and health outcomes	Wrong research design
66	Systematic review and meta-analysis comparing land and aquatic exercise for people with hip or knee arthritis on function, mobility and other health outcomes	Wrong research design
67	Defining greenspace: Multiple uses across multiple disciplines	Wrong intervention
68	Upright water-based exercise to improve cardiovascular and metabolic health: A qualitative review	Wrong research design
69	Implications of the modifiable areal unit problem for assessing built environment correlates of moderate and vigorous physical activity	Wrong intervention

70	The feasibility and short-term benefits of Blue Prescription: a novel intervention to enable physical activity for people with multiple sclerosis	Wrong intervention
71	From Green Space to Green Prescriptions: Challenges and Opportunities for Research and Practice	Wrong intervention
73	Images of nature in relation to mood modifying medicines: a user perspective	Wrong intervention
74	Conservation of Wetlands and Other Coastal Ecosystems: a Commentary on their Value to Protect Biodiversity, Reduce Disaster Impacts, and Promote Human Health and Well-Being	Wrong context
75	A historical and critical analysis of park prescriptions	Wrong intervention
76	Garden therapy in neurorehabilitation: well-being and skills improvement	Wrong intervention
77	The Association of Knowledge, Attitudes and Access with Park Use before and after a Park-Prescription Intervention for Low-Income Families in the US	Wrong intervention
78	Residential greenspace is associated with mental health via intertwined capacity-building and capacity-restoring pathways	Wrong intervention
79	Measuring Biophysical and Psychological Stress Levels Following Visitation to Three Locations with Differing Levels of Nature	Wrong research design
80	Comparisons of the Health Benefits of Strength Training, Aqua-Fitness, and Aerobic Exercise for the Elderly	Wrong context
82	Perceptions of Nature and Access to Green Space in Four Urban Neighborhoods.	Wrong intervention
83	Prescription of physical activity by general practitioners: The Biarritz Côte Basque Sport Santé experience	Not in English
84	Arts and cultural activity: A vital part of the health and care system.	Wrong intervention
85	Design and evaluation of a park prescription program for stress reduction and health promotion in low-income families: The Stay Healthy in Nature Everyday (SHINE) study protocol.	Wrong research design
86	The influence of different types of bathes for general health on the efficiency of combined spa and resort treatment of coronary heart disease	Wrong intervention
87	Environmental preference might mediate the benefits of nature-based therapies	Wrong research design
88	Play Therapy in Residential Treatment Centers for Children	Wrong intervention
90	Special Issue: Art Therapy and Disability Studies	Wrong research design
91	Efficacy of nature-based therapy for individuals with stress-related illnesses: randomised controlled trial	Wrong intervention
92	A Long-Term Follow-Up of the Efficacy of Nature-Based Therapy for Adults Suffering from Stress-Related Illnesses on Levels of Healthcare Consumption and Sick-Leave Absence: A Randomized Controlled Trial	Wrong intervention
93	Music in, as, or for therapy	Wrong intervention
94	Effects of horticultural therapy on elderly' health: protocol of a randomized controlled trial	Wrong intervention
95	Research note: Natural environments and prescribing in England	Wrong intervention
96	AB1108-HPR Aquatic Exercise for Women with Persistent Knee Pain. A Pilot Randomised Controlled Trial	Wrong intervention
97	Research note: Urban street tree density and antidepressant prescription rates-A cross-sectional study in London, UK	Wrong intervention
98	The 'taking place' of health and wellbeing: Towards non-representational theory	Wrong intervention
99	Salivary Cortisol in an Extreme Non-Competitive Sport Exercise: Winter Swimming	Wrong context
100	Editorial: Therapeutic lifestyle changes (TLCs) and mental health	Wrong research design
101	Forest experience and psychological health benefits: the state of the art and future prospect in Korea	Wrong context
102	Hortitherapy - complementary method in physiotherapy	Wrong intervention
103	Horticultural therapy: The 'healing garden' and gardening in rehabilitation measures at Danderyd Hospital Rehabilitation Clinic, Sweden	Wrong intervention
104	Nature-Based Therapy: Its Potential as a Complementary Approach to Treating Communication Disorders	Wrong intervention
105	Adventure therapy: a mental health promotion strategy in pediatric oncology.	Wrong research design
106	Effectiveness of prescribing physical activity in parks to improve health and wellbeing-the park prescription randomized controlled trial	Wrong intervention
107	If people are attached to plants, do they love other people? case of the Russian youth	Wrong intervention
108	Diving and mental health: the potential benefits and risks from a survey of recreational scuba divers	Wrong context

109	Nature-Based Social Prescribing in Urban Settings to Improve Social Connectedness and Mental Well-being: a Review	Wrong research design
110	Walking green: Developing an evidence base for nature prescriptions	Wrong intervention
111	Subtypes of park use and self-reported psychological benefits among older adults: A multilevel latent class analysis approach	Wrong context
112	A smartphone app for improving mental health through connecting with urban nature	Wrong context
113	Working out what works: The role of tacit knowledge where urban greenspace research, policy and practice intersect	Wrong intervention
114	A narrative and systematic review of the behavioural, cognitive and emotional effects of passive nature exposure on young people: Evidence for prescribing change	Wrong research design
115	Arts for the Blues – a new creative psychological therapy for depression: a pilot workshop report	Wrong intervention
116	Nature RX: Reemergence of pediatric nature-based therapeutic programs from the late 19th and early 20th centuries	Wrong research design
117	Identifying and resisting the technological drift: green space, blue space and ecotherapy	Wrong research design
118	The “healthy dose” of nature: A cautionary tale	Wrong research design
119	Falls in geriatric populations and hydrotherapy as an intervention: A brief review	Wrong research design
120	Like a Fish out of Water: Managing Chronic Pain in the Urban Safety Net	Wrong intervention
121	Cognitive benefits of walking in natural versus built environments	Wrong intervention
122	Patient uptake and adherence to social prescribing: A qualitative study	Wrong intervention
123	More green space is related to less antidepressant prescription rates in the Netherlands: A Bayesian geospatial quantile regression approach	Wrong intervention
124	Growing spaces: an evaluation of the mental health recovery programme using mixed methods	Wrong intervention
125	Exercise Prescription for a Healthy Heart	Wrong intervention
126	Hiking: A Low-Cost, Accessible Intervention to Promote Health Benefits	Wrong research design
127	A prescription for “nature” – The potential of using virtual nature in therapeutics	Wrong intervention
128	The adventure therapy experience scale: The psychometric properties of a scale to measure the unique factors moderating an adventure therapy experience	Wrong intervention
129	When Pediatric Primary Care Providers Prescribe Nature Engagement at a State Park, Do Children “fill” the Prescription?	Wrong intervention
130	Multiple health benefits of urban tree canopy: The mounting evidence for a green prescription	Wrong intervention
131	Prescribing Nature Therapy for Improved Mental Health	Wrong intervention
