Mapping the human genetic architecture of COVID-19: an update

COVID-19 Host Genetics Initiative

Abstract

The Coronavirus Disease 2019 (COVID-19) pandemic continues to pose a major public health threat especially in countries with low vaccination rates. To better understand the biological underpinnings of SARS-CoV-2 infection and COVID-19 severity we formed the COVID19 Host Genetics Initiative. Here we present GWAS meta-analysis of up to 125,584 cases and over 2.5 million controls across 60 studies from 25 countries, adding 11 new genome-wide significant loci compared to those previously identified. Genes in novel loci include *SFTPD*, *MUC5B* and *ACE2*, reveal compelling insights regarding disease susceptibility and severity.

Main text

The Coronavirus Disease 2019 (COVID-19) pandemic continues to pose a major public health threat especially in countries with low vaccination rates. To better understand the biological underpinnings of SARS-CoV-2 infection and COVID-19 severity we formed the COVID19 Host Genetics Initiative. Here we present GWAS meta-analysis of up to 125,584 cases and over 2.5 million controls across 60 studies from 25 countries, adding 11 new genome-wide significant loci compared to those previously identified[1]. Genes in novel loci include *SFTPD*, *MUC5B* and *ACE2*, reveal compelling insights regarding disease susceptibility and severity.

Additional genomic regions identified for COVID-19 severity and SARS-CoV-2 infection

Here we present meta-analyses bringing together 60 studies from 25 countries (**Figure 1; Supplementary Table 1**) for three COVID-19 related phenotypes: (1) individuals critically ill with COVID-19 based on either requiring respiratory support in hospital or who died as a consequence of the disease (9,376 cases - of which 3,197 new in this data release - and

1,776,645 controls), (2) cases with moderate or severe COVID-19 defined as those hospitalized due to symptoms associated with the infection (25,027 cases – 11,386 new - and 2,836,272 controls), and (3) all cases with reported SARS-CoV-2 infection regardless of symptoms (125,584 cases – 76,022 new - and 2,575,347 controls). An overview of the study design is provided in **Supplementary Figure 1**. We found a total of 23 genome-wide significant loci (P < 5×10^{-8}) of which 20 loci remain significant after multiple testing corrections (P < 1.67×10^{-8}) to account for the number of phenotypes examined (**Figure 2; Supplementary Figure 2; Supplementary Table 2**). We compared the effects of these loci between the previous[1] and the current analysis and found that only one locus did not replicate (rs72711165). All the other loci showed the expected increase in statistical significance (Supplementary Figure 3).

Heterogeneity in genetic effects across phenotypes, studies, and ancestry groups

Across the genome-wide significant loci, we observed clear patterns of association to the different phenotypes under study. Thus, we developed a two-class Bayesian model for classifying loci based on the patterns of association across the two better-powered phenotypes (COVID-19 hospitalization and SARS-CoV-2 reported infection). Intuitively, loci that are associated to susceptibility will also be associated to severity as to develop COVID-19, SARS-CoV-2 infection needs to first occur. In contrast, those genetic effects that solely modify the course of illness should be associated to severity to illness and not show any association to reported infection except via preferential ascertainment of hospitalized cases in a cohort (**Supplementary Methods**). We identified 16 loci that are substantially more likely (> 99% posterior probability) to impact the risk of COVID-19 hospitalization and 7 loci that clearly influence susceptibility to SARS-CoV-2 infection (**Supplementary Table 3; Supplementary Figure 4**).

We observed that several loci had a significant heterogeneous effect across studies (6/23 loci with P-value for heterogeneity < 2.2×10^{-3}; **Supplementary Table 2**). Thanks to an increased diversity in our study population (**Supplementary Figure 5**) we were able to explore if such heterogeneity was due to effect differences across continental ancestry groups. Only one locus (FOXP4) showed a significantly different effect across ancestries (P-value heterogeneity < 7×10^{-5}; **Supplementary Table 4 and Supplementary Figure 6**), though even at this locus all ancestry groups showed a positive effect estimate. This confirms that factors related to between-study heterogeneity (e.g., variable definition of COVID-19 severity due to different thresholds for testing, hospitalization, and patient recruitment) rather than differences across ancestries are a more likely explanation for the observed heterogeneity in the effect sizes across studies.

Biological insights from novel loci

For the 23 genome-wide significant loci, we explored candidate causal genes and performed a phenome-wide association study to better understand their potential biological mechanisms (**Supplementary Table 2,5,6**; **Supplementary Figure 7**). Several of these loci with prior and direct connections to lung disease and SARS-CoV-2 infection mechanism are highlighted here.

Several loci involved in COVID-19 severity implicate lung surfactant biology. A missense variant rs721917:A>G (p.Met31Thr) in *SFTPD* (10q22.3) confers risk for hospitalization (OR [95% confidence interval [CI] = 1.06 [1.04, 1.08]; $P = 1.7 \times 10^{-8}$) and has been previously associated with increased risk of chronic obstructive pulmonary disease[2] (OR = 1.08; $P = 2.0 \times 10^{-8}$), and decreased lung function[3] (FEV1/FVC; $\beta = -0.019$; $P = 2.0 \times 10^{-15}$). *SFTPD* encodes the surfactant protein D (SP-D) that participates in innate immune response, protecting the lungs against inhaled microorganisms. The recombinant fragment of SP-D binds to the S1 spike protein of the SARS-CoV-2 and potentially inhibits binding to ACE2 receptor and SARS-CoV-2 infection[4]. Another missense variant rs117169628:G>A (p.Pro256Leu) in *SLC22A31* (16q24.3) also conferring risk for hospitalization (OR [95% CI] = 1.09 [1.06, 1.13]; $P = 2.6 \times 10^{-8}$). *SLC22A31* belongs to the family of solute carrier proteins that facilitate transport across membranes[5] and is co-regulated with other surfactant proteins[6].

We found a variant rs35705950:G>T located in the promoter of *MUC5B* (11p15.5) to be protective against hospitalization (OR [95% CI] = 0.83 [0.86, 0.93]; $P = 6.5 \times 10^{-9}$). This well-studied promoter variant increases expression of *MUC5B* in lung in GTEx ($P = 6.7 \times 10^{-16}$) and is the strongest known variant associated with *increased* risk of developing idiopathic pulmonary fibrosis (IPF)[7,8], but also improves survival in IPF patients carrying this mutation[9].

Finally, we identified rs190509934:T>C, located 69 bp upstream of *ACE2* (Xp22.2) to be associated with decreased susceptibility risk (OR [95% CI] = 0.69 [0.63, 0.75]; $P = 3.6 \times 10^{-18}$). ACE2 is the SARS-CoV-2 receptor and functionally interacts with *SLC6A19* and *SLC6A20*[10], one of which also showed a significant association with susceptibility (rs73062389:G>A at *SLC6A20*; OR [95% CI] = 1.18 [1.16, 1.20]; $P = 2.5 \times 10^{-74}$). Notably, rs190509934 is 10 times more common in South Asians (MAF = 0.027) than in Europeans (MAF = 0.0024), demonstrating the importance of diversity for variant discovery. Recent results have shown that rs190509934:T>C variant lowers *ACE2* expression, which in turn confers protection from SARS-CoV-2 infection[11].

We applied Mendelian randomization to infer potential causal relationships between COVID-19 related phenotypes and their genetically correlated traits (**Supplementary Methods; Supplementary Tables 7,8,9; Supplementary Figure 8**). A novel causal association was observed between genetic liability to type II diabetes (T2D) and SARS-CoV-2 reported infection (OR [95% CI] = 1.02 [1.01, 1.03]; P = 1.6 x 10-3), and COVID-19 hospitalization (OR [95% CI] = 1.06 [1.03, 1.1]; P = 1.4 x 10-4). Multivariable MR (MVMR) was used to estimate the direct effect of liability to T2D on COVID-19-related phenotypes that was not mediated via BMI. This analysis indicated that the observed causal association of liability to T2D on COVID-19 phenotypes is mediated by BMI (**Supplementary Table 10**).

Discussion

We have substantially expanded the genetic analysis of SARS-CoV-2 infection and COVID-19 severity by doubling the case size, identifying 11 novel loci. We developed a new approach to systematically assign the 23 discovered loci to either disease susceptibility (7 loci) or disease severity (16 loci). While distinguishing the two phenotypes is challenging because progression to a severe form of the disease requires susceptibility to infection in the first place, it is now evident that the genetic mechanisms involved in these two aspects of the disease can be differentiated. Among the new loci associated with disease susceptibility, *ACE2* represents an expected, yet interesting finding. *MUC5B, SFTPD,* and *SLC22A31* are the three most interesting novel loci associated with COVID-19 severity. Their relationship with lung function and lung diseases is consistent with loci previously associated with disease severity. The SPs secreted by alveolar cells, representing an emerging biological mechanism, maintains healthy lung function and facilitates the clearance of pathogens[12]. The protective effect of the *MUC5B* variant is unexpected given the otherwise risk-increasing, concordant effect between IPF and COVID-19 observed for other variants[8]. Nonetheless, this result aligns with the *MUC5B* promoter variant association that shows a twofold higher survival rate among IPF patients [9]. In mice, *Muc5b* appears essential for effective mucociliary clearance and for controlling infection[13] supporting therapies to control mucin secretion to be of potential benefit in COVID-19 patients.

Expanding genomic research to include participants from around the world enabled us to test if the effect of COVID-19related genetic variants was markedly different across ancestry groups. We didn't detect obvious heterogeneity between ancestry groups, and we attribute the observed heterogeneity in the effect of COVID-19 related genetic variants to the diverse inclusion criteria across studies in terms of COVID-19 severity. However, we also note that ascertainment differences across studies might mask true underlying differences in effect sizes between ancestry groups.

The novel biological insights gained by this expansion of the COVID-19 Host Genetic Initiative showed that increasing sample size and diversity remain a fruitful activity to better understand the human genetic architecture of COVID-19.

Data Availability
Summary statistics generated by COVID-19 HGI are available at https://www.covid19hg.org/results/r6/ . The analyses described here utilize the freeze 6 data. COVID-19 HGI continues to regularly release new data freezes. Summary statistics for non-European ancestry samples are not currently available due to the small individual sample sizes of these groups, but results for 23 loci lead variants are reported in Supplementary Table 3. Individual level data can be requested directly from contributing studies, listed in Supplementary Table 1. We used publicly available data from GTEx (https://gtexportal.org/home/), the Neale lab (http://www.nealelab.is/uk-biobank/), Finucane lab (https://www.finucanelab.org), FinnGen Freeze 4

cohort (https://www.finngen.fi/en/access_results), and eQTL catalogue release 3 (http://www.ebi.ac.uk/eqtl/).

Code Availability

The code for summary statistics lift-over, the projection PCA pipeline including precomputed loadings and meta-analyses are available on GitHub (https://github.com/covid19-hg/) and the code for the Mendelian randomization and genetic correlation pipeline is available on GitHub at https://github.com/marcoralab/MRcovid. Code for implementing the MVMR analysis is available at: https://github.com/marcoralab/multivariate_MR ; and subtype analyses at: https://github.com/mjpirinen/covid19-hgi_subtypes

Figure Legends

Figure 1 | Panel A: Geographical overview of the contributing studies to the COVID-19 HGI and composition by major ancestry groups. Populations are defined as Middle Eastern (MID), South Asian (SAS), East Asian (EAS), African (AFR), Admixed American (AMR), European (EUR). **Panel B**. **Principal components analysis** highlights the population structure and the sample ancestry of the individuals participating to the COVID-19 HGI. This figure is an updated version of the figure published by the COVID-19 Host Genetics Initiative [1].

Figure 2 | Genome-wide association results for COVID-19. A. Top panel shows results of genome-wide association study of hospitalized COVID-19 (n=25,027 cases and n=2,836,272 controls), and bottom panel the results of reported SARS-CoV-2 infection (n=125,584 cases and n=2,575,347 controls). Loci highlighted in yellow (top panel) represent regions associated with severity of COVID-19 manifestation. Loci highlighted in green (bottom panel) are regions associated with susceptibility to SARS-CoV-2 infection. Lead variants for the loci newly identified in this data release are annotated with their respective rsID. **B**. Results of gene prioritization using different evidence measures of gene annotation. Genes in linkage disequilibrium (LD) region, genes with coding variants and eGenes (fine-mapped cis-eQTL variant PIP > 0.1 in GTEx Lung) are annotated if in LD with a COVID-19 lead variant (r2 > 0.6). V2G: Highest gene prioritized by OpenTargetGenetics' V2G score. The * indicates SARS-CoV-2 infection susceptibility and + indicates COVID-19 severity. The transparent loci were reported in the previous freeze (data release 5), and loci in bright blue were identified in the current freeze (data release 6). This figure is an updated version of the figure published by the COVID-19 Host Genetics Initiative [1].

362. Genomics England
363. Queen Mary University, London, United Kingdom
364. William Harvey Research Institute, Barts and the London School of Medicine and Dentistry, Queen Mary University of London, London EC1M 6BQ, UK
365. UCL Great Ormond Street Institute of Child Health, London, United Kingdom
366. Genomics England, London, United Kingdom
367. University of Cambridge, London, United Kingdom
368. Department of Human Genetics, McGill University, Montréal, Québec, Canada. Lady Davis Institute, Jewish General Hospital, McGill University, Montréal, Québec, Canada. Kyoto-McGill International Collaborative School in Genomic Medicine, Graduate School of Medicine, Kyoto University, Kyoto, Japan. Research Fellow, Japan Society for the Promotion of Science
369. Big Data Institute, Nuffield Department of Population Health, University of Oxford, Li Ka Shing Centre for Health Information and Discovery, Old Road Campus, Oxford, OX3 7LF, United Kingdom
370. Genomics PLC, King Charles House, Park End Street, Oxford, OX1 1JD, United Kingdom
371. Nuffield Department of Medicine, Experimental Medicine Division, University of Oxford, John Radcliffe Hospital, Oxford, OX3 9DU, United Kingdom

372. Public Health England, Field Service, Addenbrooke's Hospital, Cambridge, CB2 0QQ, United Kingdom

373. Public Health England, Data and Analytical Services, National Infection Service, London, NW9 5EQ, United Kingdom

374. Program in Bioinformatics and Integrative Genomics, Harvard Medical School, Boston, MA, USA

375. Program in Biological and Biomedical Sciences, Harvard Medical School, Boston, MA, USA

376. Wellcome Centre for Human Genetics, University of Oxford, Roosevelt Drive, Oxford, OX3 7BN, United Kingdom

377. Department of Clinical Research and Leadership, George Washington University, Washington, DC, USA

378. Department of Human Genetics, The Wellcome Sanger Institute, Wellcome Genome Campus, Hinxton, Cambridge, CB10 1HH, UK

379. The National Institute for Health Research Blood and Transplant Unit in Donor Health and Genomics, University of Cambridge, Strangeways Research Laboratory, Wort's Causeway, Cambridge, CB1 8RN, UK

380. Department of Haematology, University of Cambridge, Cambridge Biomedical Campus, Long Road, Cambridge, CB2 0PT, UK

381. British Heart Foundation Cardiovascular Epidemiology Unit, Department of Public Health and Primary Care, University of Cambridge, Cambridge, UK

382. British Heart Foundation Centre of Research Excellence, University of Cambridge, Cambridge, UK

383. National Institute for Health Research Blood and Transplant Research Unit in Donor Health and Genomics, University of Cambridge, Cambridge, UK

384. Health Data Research UK Cambridge, Wellcome Genome Campus and University of Cambridge, Cambridge, UK

385. Department of Human Genetics, Wellcome Sanger Institute, Hinxton, UK

386. Department of Epidemiology, Emory University Rollins School of Public Health

387. Atlanta CA Health Care System, North Druid Hills, GA, USA

388. Center for Population Genomics, MAVERIC, VA Boston Healthcare System, Boston, MA, USA

389. MAVERIC, VA Boston Healthcare System, Boston, MA, USA

390. Stanford University

391. Palo Alto VA Healthcare System, Stanford, CA, USA

392. Department of Biostatistics, Boston Univeristy School of Public Health

393. Vanda Pharmaceuticals Inc.

394. Stroke Pharmacogenomics and Genetics, Biomedical Research Institute Sant Pau, Sant Pau Hospital, Barcelona, Spain

395. Institute for Biomedical Researhc of Barcelona (IIBB), National Spanish Research Council (CSIC)

396. Institut d'Investigacions Biomèdiques August Pi i Sunyer (IDIBAPS), Barcelona, Spain

397. Institute of Biomedicine of Valencia (IBV), CSIC, València, Spain

398. Network Center for Biomedical Research on Neurodegenerative Diseases (CIBERNED), València, Spain

399. Neurology and Genetic Mixed Unit, La Fe Helath Research Institute, València, Spain

400. Institute for Biomedical Research of Barcelona (IIBB), National Spanish Research Council (CSIC)

401. Department of Neurology, Hospital Universitari MútuaTerrassa, Fundació Docència i Recerca MútuaTerrassa, Terrassa, Spain

402. Department of Molecular and Cell Biology, Centro Nacional de Biotecnología (CNB-CSIC), Campus Universidad Autónoma de Madrid, 28049 Madrid, Spain

403. Instituto de Física de Cantabria (IFCA-CSIC)

404. Hospital Clínic, IDIBAPS, Barcelona, Spain

405. Hospital Clínic, Barcelona, Spain

406. Hospital Clínic, IDIBAPS, School of Medicine, University of Barcelona Barcelona, Spain
407. IDIBAPS, Barcelona, Spain
408. IIBB-CSIC, Barcelona, Spain
409. Servicio de Salud del Principado de Asturias, Oviedo, Spain
410. Hospital Mutua de Terrassa, Terrassa, Spain
411. Hospital Valle Hebrón, Barcelona, Spain
412. Instituto de Biomedicina y Genética Molecular (IBGM), CSIC-Universidad de Valladolid, Spain
413. Hospital Clínico Universitario de Valladolid (SACYL)
414. Department of Neurology, University Hospital of Albacete.
415. Department of Neurology
416. Research Unit, University Hospital of Albacete
417. Department of Neurology, Biomedical Research Institute Sant Pau (IIB Sant Pau), Hospital de la Santa Creu i Sant Pau, Barcelona (Spain)
418. Hospital Universitario Ramón Y Cajal, IRYCIS, Madrid, Spain
419. Institute de Biomedicine of Seville, IBiS/Hospital Universitario Virgen del Rocío/CSIC/University of Seville & Department of Neurology, Hospital Universitario Virgen Macarena, Seville.
420. Brigham and Women's Hospital, Boston, USA
421. Harvard Medical School, Boston, MA
