26 **ABSTRACT**

27 **Background:** Global plastic production has increased exponentially since the 1960s, with
28 more than 6300 million metric tons of plastic waste generated to date. Studies have found a
29 range of human health impacts associated with exposure to plastic chemicals. However, only
30 a fraction of plastic chemicals used have been studied *in vivo*, and then often in animals, for
31 acute toxicological effects. With many questions still unanswered about how long-term
32 exposure to plastic impacts human health, there is an urgent need to map human *in vivo* research
33 conducted to date, casting a broad net by searching terms for a comprehensive suite of plastic
34 chemical exposures and the widest range of health domains.

35

36 **Methods:** This protocol describes a scoping review that will follow the recommended
37 framework outlined in *2017 Guidance for the Conduct of Joanna Briggs Institute (JBI) Scoping*
38 *Reviews*, to be reported in accordance with *Preferred Reporting Items for Systematic Reviews*
39 *and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) Checklist*. A literature
40 search of primary clinical studies in English from 1960 onwards will be conducted in
41 MEDLINE (Ovid) and EMBASE (Ovid) databases. References eligible for inclusion will be
42 identified through a quality-controlled, multi-level screening process. Extracted data will be
43 presented in diagrammatic and tabular form, with a narrative summary addressing the review
44 questions.

45

46 **Discussion:** This scoping review will comprehensively map the primary research undertaken
47 to date on plastic exposure and human health. Secondary outputs will include extensive
48 databases on plastic chemicals and human health outcomes/impacts.

49

50 **Keywords:** human, plastic, plastic chemicals, polymers, additives, exposure, health, toxicity

51

52 **Registration:** Open Science Framework (OSF)-Standard Pre-Data Collection Registration,
53 <https://osf.io/gbxps> DOI: 10.17605/OSF.IO/GBXPS

54

55 **BACKGROUND**

56 Continuous human exposure to plastic chemicals has become inevitable due to its ubiquity in
57 the environment (1,2). ‘Plastic’ is a broad term for material made up of polymers and usually
58 a number of chemical additives that impart desirable properties, such as flexibility and fire
59 resistance (3,4). We will use the term ‘plastic materials’ as an umbrella term inclusive of
60 plastic chemicals, plastic products and plastic particles; and ‘plastic chemicals’ to refer to
61 polymers, monomers and/or additives.

62

63 As of 2017, approximately 8300 million metric tons (Mt) of virgin plastic chemicals had been
64 produced, and as of 2015, 6300 million Mt of plastic waste generated (5). While some of the
65 plastic waste is recycled or incinerated (5), the majority accumulates in landfills or in the
66 environment (5), as macroplastic debris in the oceans (6–8), as microparticles in air (9–11),
67 micro- or nanoparticles in soils (12–14) and in water supplies (15–18).

68

69 Plastic materials are used in every aspect of our lives (19) and common routes of exposure to
70 plastic chemicals and particles (20) include inhalation (21), ingestion (including trophic
71 transfer) (22–24), and direct dermal contact (25–27). Furthermore, children are exposed
72 prenatally to plastic chemicals through maternal and paternal exposure (28), as well as
73 postnatally through breast milk (29).

74

75 Of the thousands of plastic chemicals in use globally today, more than 20% have been
76 identified as substances of concern by the European Union on the basis of persistence,
77 bioaccumulation and/or toxicity, while 39% remain unclassified in terms of hazard (30). Some
78 plastic chemicals are persistent organic pollutants that are known to bioaccumulate in human
79 fatty tissues (31). A growing body of evidence links human exposure to various plastic
80 chemicals with adverse health impacts (32–35) and public concern about the threat of plastic
81 pollution on our health is high (36). Despite this, research efforts have focused on a few plastic
82 chemicals for which established measurement techniques exist (37) and for which a limited
83 range of health impacts have been identified – primarily endocrine disruption (38–40),
84 reproductive toxicity (41,42), carcinogenicity (43,44), metabolic and nutritional conditions
85 (45), and neurodevelopment (46,47). The findings of these studies are often inconsistent, as
86 plastic chemical exposure can show sex-specific effects (38), differentially affect
87 developmental stages (48), have health outcomes in association with specific plastic chemical
88 mixtures (38), and can elicit non-monotonic responses (34). There is insufficient published
89 data on the toxicity of micro- and nano-plastics in humans (49,50), however an absence of
90 evidence of toxicity does not equate to evidence of safety (51).

91

92 We are not aware of any sources or publications comprehensively summarising research
93 conducted to date on how plastic chemicals and plastic particles are impacting human health,
94 or which populations, demographically and geographically, have been studied in this respect.
95 Preliminary searches conducted in Prospero, Epistimonikos, Cochrane, Medline (Ovid) and
96 Embase (Ovid) databases in May 2020 did not identify any previous or current scoping review
97 on this broad topic. A number of systematic and literature reviews were identified, focusing on
98 a small number of classes of plastic chemicals, such as phthalates, and bisphenol A (52–55),
99 and certain diseases associated with these chemical species (56,57). These systematic and

100 literature reviews addressed only a few specific chemicals and did not evaluate non disease-
101 specific health domains, such as changes in gene expression, oxidative stress and the
102 microbiome. Demographic and geographic bias (for example, due to social equity issues) were
103 not evaluated, suggesting that many populations could be under-represented in the literature.
104 For example, young children could be highly exposed and particularly vulnerable to the effects
105 of some plastic chemicals (53,58), and populations in developing countries could be at
106 increased exposure risk (59) due to a combination of higher plastic pollution burden (60),
107 combined with inadequate waste management facilities and lower occupational health and
108 safety regulations (61).

109

110 To demonstrate the scope of research conducted to date, and to inform future research efforts,
111 we will conduct a scoping review to chart published primary human *in vivo* studies that
112 investigated the relationship between exposure to plastic materials and human health since
113 1960. The scoping review aims to summarise the research to date, identify knowledge gaps
114 and provide a framework for future studies in areas requiring more in-depth research.

115

116 **Review question**

117 In primary human *in vivo* research conducted since 1960 on the effects of plastic materials on
118 health, which plastic chemicals/particles and which health domains have (and have not) been
119 investigated?

120

121 In relation to our main question, the following questions will inform sub-analyses:

- 122 1. Which populations (geographically, by age group, sex and general/special exposure
123 risk status) have been examined?
- 124 2. Which study designs were adopted?

125 3. When were these studies conducted over time (Jan 1960–Jan 2021)?

126

127 **Inclusion and exclusion criteria**

128 The Population, Exposure and Outcome (PEO) mnemonic (Table 1) was created to construct
129 clear inclusion criteria

130

131 Table 1: PEO framework for identifying the research question and inclusion criteria.

Criteria	Determinants
Population	Global human populations of all ages, including the developing fetus
Exposure	Directly <i>in vivo</i> measured exposures to included plastic materials
Outcome	Direct <i>in vivo</i> physiological or psychological health outcome measures

132

133 ***Population***

134 The review will consider studies that investigate any population globally, and any age group,
135 including the developing fetus. Animal studies and *in vitro* human studies will be excluded.

136

137 ***Exposure***

138 Only *in vivo* directly measured exposures (i.e. via bio-samples, including for example blood,
139 urine, breast milk and adipose tissue) of plastic materials that meet inclusion criteria will be
140 included. All avenues of plastics exposure are considered relevant, including environmental
141 contact via activities of everyday living, occupational exposure, accidental ingestion through
142 contaminated food or water, cross-placental exposure, and ingestion through breast milk.

143

144 *Plastics inclusion and exclusion criteria*

145 This scoping review focuses on plastic materials to which humans are generally exposed, other
146 than at the point of synthesis or product manufacturing. A systematic decision-making process
147 (Figure 1) will be applied to determine the inclusion or exclusion of plastic chemicals. Briefly,
148 plastic additives and synthetic polymers will be identified from preselected references: seven
149 for additives (62–68), and seven for polymers (69–75). Chemicals that are classified as *additive*
150 – *plasticiser*, *additive – flame retardant*, *per- and polyfluoroalkyl substances (PFAS)*,
151 *individual polymer* or *polymer class* and *bisphenols* will be included, unless commonly used
152 in biomedical applications or as food additives (since inclusion would result in the retrieval of
153 many thousands of references unrelated to the effects of plastic chemicals on health).
154 Additional plastic chemicals identified during the screening process, or missing plastic
155 chemicals that are structurally and systematically related to included substances (based on
156 expert decision by Authors JA and MB, postdoctoral degrees in chemistry), will undergo the
157 same selection criteria and subsequently included or excluded. Polymer metabolites,
158 monomers other than bisphenols, and plastic additives other than plasticisers and flame
159 retardants, are excluded from this review.

160

161 A comprehensive and searchable database of included plastic chemicals will be developed,
162 indexing the multiple names, synonyms and commonly used terminology describing these
163 chemicals.

164

165 ***Outcome***

166 Only physiological and psychological changes in human health that are directly measured *in*
167 *vivo* are included.

168

169 *Human Health Outcome Measures*

170 Health outcome measures include any assessment of change in structure or function of the
171 human body, whether undertaken at the clinical, functional, physiological or cellular level.
172 From preliminary searches, we anticipate encountering three types of health-related impact
173 assessments in relation to plastics exposures:

174

- 175 1. Measures of direct impact on human health as a diagnosis of illness or disease, for
176 example, breast cancer;
- 177 2. Clinical measures to detect a disease/disorder where no illness/disease has been
178 diagnosed, for example oestrogen levels as a measure of change in ovarian function;
179 and
- 180 3. Measures of impact on physiological or biochemical measures within an organ/body
181 system that are not associated with a specific disorder, for example genetic and
182 epigenetic changes and measures of metabolism and oxidative stress.

183

184 We will include measures of all the health-related impacts listed above, classifying them within
185 the body system/organ in which they were investigated, using the hierarchical structure of the
186 *International Classification of Disease 11th Revision (ICD-11) (76)*.

187

188 *Types of sources*

189 This scoping review considers peer-reviewed journal articles presenting primary human
190 research, inclusive of all study designs. Excluded sources are literature/systematic reviews,
191 meta-analyses, editorials, book reviews/chapters, perspectives, opinion/commentary pieces,
192 conference abstracts and proceedings, and grey literature.

193

194 **METHODS**

195

196 *Design*

197 The scoping review uses the methodological framework as described in the *Updated*
198 *methodological guidance for the conduct of scoping reviews* (77) and reporting will be
199 compliant with the *Preferred reporting items for systematic reviews and meta-analyses*
200 *extension for scoping reviews (PRISMA-ScR) Checklist* (78) (see Additional file I for
201 completed PRISMA-P checklist accompanying this Protocol) and informed by *Conducting*
202 *high quality scoping reviews – challenges and solutions* (79).

203

204 *Constructing the search strategy*

205 The search strategy aims to find published plastic chemicals/particles and human health studies
206 from 1960 onwards. The starting point of 1960 was selected since, although large-scale use of
207 plastic dates back to ~1950, significant increases in global production occurred from the 1960s
208 onward (5).

209

210 We identified key articles relevant for our scoping review by conducting an initial scoping
211 search in Medline (Ovid) and Embase (Ovid) databases and examining the hierarchy of
212 controlled vocabulary in these databases (MeSH and Emtree respectively). Indexed terms were
213 selected representing plastic materials (including commonly used terms for chemical classes
214 meeting our inclusion criteria) and a broad range of health outcome categories informed by
215 preliminary searches and expert input from Author CS, a consultant paediatrician with relevant
216 research expertise (most human health categories being represented, except for those obviously
217 unrelated to plastic chemical exposure or likely to result in the retrieval of many irrelevant
218 results). MeSH and Emtree terms, corresponding text words, text words contained in the titles

219 and abstracts of key articles, and terms and synonyms for all specific plastic chemicals included
220 in our database, will comprise the final search strategy, being developed in consultation with
221 Research Librarian, Author TS. A large number of exclusion terms such as “plastic surgery”,
222 plasticity, etc., will be utilised to minimise irrelevant results.

223

224 In summary, the search strategy will include: Health outcomes AND plastic material exposures
225 NOT exclusions, limited to English language and dates ranging from 1960 to current. A search
226 filter will be used in each database (Medline and Embase, via the Ovid platform) to identify
227 human-only studies and exclude animal studies (80–82). The keywords and indexed terms
228 representing health outcomes will be combined with Boolean operator OR and combined using
229 the Boolean Operator AND with the keywords and indexed terms for plastic materials. The
230 proximity operator ADJ will capture terms adjacent within a tested number of words within
231 the title and abstract fields, and the truncation symbol * will be used where appropriate.

232

233 Scopus and Web of Science databases were investigated as sources, however due to the lack
234 of controlled vocabulary and no filters for human-only studies, these will not be searched.

235

236 In anticipation of a very large number of results from this search, the reference lists of retrieved
237 papers will not be reviewed. We will, however, review the reference lists associated with a
238 related ‘Umbrella Review’ of systematic reviews with meta-analyses on this topic, being
239 conducted by Minderoo Foundation and reported separately (*in preparation*).

240

241 *Study selection*

242 All identified articles will be collated and uploaded into the DistillerSR (Evidence Partners,
243 Ottawa, Canada) systematic review software application for screening and data extraction, and

244 deduplicated. Relevant articles will then be selected via two screening stages, each preceded
245 by an in-depth training process for the team of reviewers, who have postgraduate and
246 postdoctoral degrees in chemistry, biochemistry, environmental and health sciences. Training
247 will involve the provision of guidelines, including inclusion/exclusion criteria and practical
248 examples of their application, education on classifying study design, access to our database of
249 included plastic chemicals and demonstration of the screening process using relevant articles
250 to be included for the scoping review, ensuring consistency and reliability of assessment
251 decisions.

252
253 References will first be screened for relevance by title, abstract and index terms. Reviewers
254 will initially screen several sets of the same 100 references and discuss their screening
255 decisions, proceeding to single-screening after achieving an 85% level of agreement with
256 subsequently agreed (resolved) group decisions over three sets. Articles with no abstract but
257 potentially relevant to the scoping review will be included at the first screening stage. Auditing
258 will be performed on a random selection of screened references to evaluate screening accuracy,
259 and we will use the inbuilt artificial intelligence (DistillerAI) tool to identify possible false
260 exclusions, re-screening references as necessary and thereby minimising the number of
261 valuable articles being discarded.

262
263 During the second screening stage, full-text articles will be reviewed for eligibility. Training
264 will again involve the screening of several sets of full-texts, with discussions after each set
265 about screening decisions. Reviewers will proceed to single-screening only after achieving an
266 85% level of agreement with subsequently resolved group decisions and excluding no more
267 than two eligible articles in error per 100 full-texts. Eligible articles will be included for data

268 extraction, whereas articles excluded once will require a second reviewer to confirm the
269 exclusion. Any disagreements will be resolved by a third reviewer with relevant experience.

270

271 **DATA EXTRACTION**

272 The data to be extracted will include specific publication details, study characteristics, relevant
273 plastic exposures detected in the body and the health outcome measures analysed in relation to
274 plastic exposures. Data extraction forms designed in DistillerSR (drafts are provided in
275 Additional file II) will be piloted extensively during a period of training, involving independent
276 reviewing followed by group meetings to discuss decisions and revise forms as necessary (final
277 versions to be provided in the scoping review paper). Two reviewers will extract data from
278 each full-text. Reviewer pairs will discuss conflicts that arise, with input from a third reviewer
279 with the most relevant expertise if assistance is required to resolve decisions. Articles may be
280 excluded during this phase if found ineligible or if it is impossible to extract data due to
281 ambiguity or poor reporting quality, with the reasons for exclusion reported in the final paper.

282

283 The findings reported in the included studies, i.e. correlations between plastic exposures and
284 health outcome measures, or lack thereof, will not be recorded, since we are following the
285 typical scoping review framework, without conducting quality assessment of retrieved articles.
286 The afore-mentioned ‘Umbrella Review’ of systematic reviews with meta-analyses will
287 capture high-level evidence on this topic.

288

289 **DATA ANALYSIS AND PRESENTATION**

290 Frequency counts and descriptive statistics will be presented for publication details and study
291 characteristics. The extracted data will be presented graphically, in diagrammatic and tabular

292 form, in a manner that aligns with the objective of this scoping review. A narrative summary
293 will accompany the tabulated and charted results.

294
295 Graphical illustrations will show the trend, by year of publication, for when studies about the
296 impact of plastics and health were conducted; the number of articles by country of authors and
297 investigated study populations; age ranges and sex of participants; frequency of the different
298 study designs used; the plastic chemical/particle exposures and health outcome measures. The
299 results will be presented to address the research questions, make comparisons, identify
300 methodologies used and identify research gaps.

301
302 **DISCUSSION**

303 This scoping review aims to provide a comprehensive overview of research published since
304 1960 on the exposure of humans to plastic materials and the health outcomes assessed. Due to
305 the breadth of our review question, we anticipate a large number of studies to intersect with the
306 PEO framework. A detailed search strategy has been designed to identify eligible studies based
307 on all three criteria: *in vivo* human populations, directly measured plastic materials that are
308 included according to clear criteria and scientifically reliable sources, and direct measures of
309 human health outcomes.

310
311 While health outcomes traditionally involve diseases and health conditions, the potential
312 impacts of plastic materials may be subtle, perhaps only becoming apparent over time. By
313 adapting the ICD-11 sub-categories to include health outcomes not necessarily classified as
314 disease states (e.g. epigenetic changes and oxidative stress measures), this scoping review aims
315 to identify a wider suite of health-related outcome measures that should be taken into

316 consideration for plastic exposure research. This database could also benefit future research
317 endeavours.

318

319 In summary, this scoping review will provide an overview of the research so far undertaken on
320 plastic material exposure and human health. This can serve as a basis to identify research
321 clusters, by topic and geographical location of studied populations, as well as knowledge gaps,
322 helping to prioritise specific areas in need of more in-depth research. Additionally, alongside
323 the primary outputs, findings may be used to strengthen efforts to better regulate the production,
324 importation and use of plastic materials that human populations are ubiquitously exposed to.

325

340 PRISMA-ScR: *Preferred reporting items for systematic reviews and meta-analyses extension*
341 *for scoping reviews*

342

343 **Definitions**

344 plastic chemicals: polymers, monomers and/or additives

345 plastic materials: plastic chemicals, plastic products and plastic particles

346

347 **Acknowledgements**

348 The selection of specific plastic materials and associated terms was determined in consultation
349 with polymer science expert Dr Marck Norret, The University of Western Australia. We also
350 acknowledge the contribution from Brady Johnston, Minderoo Foundation, to create
351 searchable online databases of our included plastics and health outcome measures, using the
352 “Shiny” package in RStudio; and from Meredith Ryland and Joanne Webb, Minderoo
353 Foundation, towards the writing of this manuscript.

354

355 **Authors’ contributions**

356 *Scoping review design:* Sarah A. Dunlop, Christos Symeonides, Louise M. Goodes, Delia
357 Hendrie, Tristan Dale, Hamish Newman, Enoch V.S. Wong, Priyanka Toshniwal

358 *Manuscript:* Louise Goodes, Enoch V.S. Wong, Louise Mofflin, Priyanka Toshniwal,

359 Manuel Brunner, Terena Solomons, Yannick Mulders, Sarah A. Dunlop (guarantor)

360 *Review of Manuscript:* Christos Symeonides, Jennifer Alex, Tristan Dale, Hamish Newman,

361 Andrew Lowe, Delia Hendrie

362 *Identification of plastics and their sources:* Emily White, Jennifer Alex, Christos Symeonides,

363 Andrew Lowe

364 *Classification of study designs, health outcomes and measures:* Bhedita Seewoo, Christos

365 Symeonides, Louise Mofflin

366 *Coding and data management:* Omrik Choudhury, Enoch V.S. Wong

367

368 **Funding**

369 This scoping review was supported by Minderoo Foundation.

370

371 **Availability of data and materials**

372 All data generated or analysed will be included in the final published scoping review article

373 and additional information related to the protocol will be available upon reasonable request.

374

375 **Ethics approval and consent to participate**

376 Formal research ethics approval is not required for scoping review the published literature. The

377 findings of the scoping review will be disseminated via Minderoo Foundation website, peer-

378 reviewed scientific publication, presented at congresses or conferences, to policy makers and

379 stakeholders aiming to achieve a world free of plastic pollution, and through various social

380 media platforms. Data deposition and curation will be managed by Minderoo Foundation.

381

382 **Consent for publication**

383 Not applicable.

384

385 **Competing interests**

386 The authors declare they have no competing interests and they have developed this protocol

387 without input from any funding body.
