23 **Abstract**

24

25 **VEGFR2 is a central regulator of placental angiogenesis. The study of the VEGFR2**
26 **proteome of chorionic villi at term revealed its partners MDMX and PICALM. The**
27 **oxytocin receptor (OT-R) and vasopressin V1aR receptor were detected in MDMX**
28 **and PICALM immunoprecipitations. Immunogold electron microscopy showed**
29 **VEGFR2 on endothelial cell (EC) nuclei, mitochondria, and Hofbauer cells (HC), the**
30 **tissue-resident macrophages. MDMX, PICALM, and V1aR were on EC plasma**
31 **membranes, nuclei, and HC nuclei. Unexpectedly, PICALM and OT-R were detected**
32 **on EC projections into the fetal lumen and OT-R on 20-150 nm clusters therein,**
33 **prompting the hypothesis that placental exosomes transport OT-R to the fetus and**
34 **across the blood-brain barrier. Insights on gestational complications were gained**
35 **by univariable and multivariable regression analyses associating preeclampsia with**
36 **lower MDMX protein levels in membrane extracts of chorionic villi, and lower MDMX,**
37 **PICALM, OT-R, and V1aR with spontaneous vaginal deliveries compared to**
38 **cesarean deliveries before labor. We found select associations between higher**
39 **MDMX, PICALM, OT-R and either gravidity, diabetes, BMI, maternal age, or neonatal**
40 **weight, and correlations between PICALM-OT-R ($p < 2.7 \times 10^{-8}$), PICALM-V1aR**
41 **($p < 0.006$), and OT-R-V1aR ($p < 0.001$). These results offer for exploration new**
42 **partnerships in metabolic networks, tissue-resident immunity, and labor, notably**
43 **for HC that predominantly express MDMX.**

44

45

46 The placenta is a transient organ that performs the functions of major organs of the fetus,
47 such as lungs, liver, and kidney¹, supplies the fetus and in particular the fetal brain with
48 oxygen and nutrients, and facilitates waste disposal and provides immune protection^{2,3}.
49 The genomes of placenta and fetus are identical except in cases of confined placental
50 mosaicism. The vascular endothelial growth factor A (VEGF-A) is a key regulator of
51 vasculogenesis, angiogenesis and placental growth that acts mainly through VEGFR1 and
52 VEGFR2, two tyrosine kinase single-pass transmembrane receptors⁴⁻⁶.

53 Preeclampsia is a serious complication of human pregnancy occurring in 5-7% of
54 all gestations with newly-onset hypertension and proteinuria as its primary clinical
55 characteristics^{2,7}. Preeclampsia is a multisystemic syndrome of different subtypes
56 associated with serious health problems to mother and child even after pregnancy⁸. Lipid
57 bilayer-enclosed extracellular vesicles (EV) transport extracellular nucleic acids, proteins,
58 lipids, and metabolites⁹⁻¹². Cancer cells deploy EV to activate VEGF signaling in
59 endothelial cells¹². Exosomes are EV measuring 20–150 nm in diameter. Placental-
60 derived exosomes released in the maternal circulation are associated with pregnancy
61 disorders and parturition¹¹.

62 Tissue-based maps of the human proteome of many organs, including placentas,
63 have been published,¹³⁻¹⁶ but great challenges remain to discover which among the
64 hundreds of detected proteins regulate key metabolic networks, specifically, during normal
65 and complicated pregnancies and labor. To obtain such information, we chose to
66 immunoprecipitate VEGFR2, an ideal target as an extensively documented regulator of
67 placental angiogenesis. To deploy a wide net for the membrane partners of VEGFR2, we
68 analyzed the pellets obtained after high-speed centrifugation of chorionic villi
69 homogenates. Uterine blood in the maternal intervillous space exchanges substances with
70 fetal blood at the villous tree. Although the villi are physically separated from uterine
71 blood^{1,3}, the pellets contain cells and EV from it. To preserve protein complexes, we
72 extracted the pellets with ASB-14 (amidodisulfobetaine-14), an efficient non-denaturing
73 detergent. The extracts were immunoprecipitated with the bait antibody (Ab) charged on
74 magnetic beads knowing that extraction of membrane proteins from their native
75 environment could alter their structure and protein links. Mass spectrometry identified
76 proteins immunoprecipitated with VEGFR2, especially its newly discovered placental

77 partners, the multifunctional MDMX (Double minute 4 protein) and PICALM
78 (Phosphatidylinositol-binding clathrin assembly protein).

79 MDMX, also known as MDM4 and HDMX, is a zinc-binding protein and a p53
80 inhibitor acting in coordination with MDM2, a zinc-dependent E3 ubiquitin ligase¹⁷. MDMX
81 and MDM2 have numerous p53-independent activities. In preeclampsia, p53 is
82 upregulated in villous trophoblasts¹⁸. PICALM is a nuclear and plasma membrane protein
83 that interacts with phosphatidylinositol to recruit clathrin and adaptor protein-2, initiates
84 endocytosis of clathrin-coated vesicles, internalizes ligand-receptor complexes, and
85 participates in iron and cholesterol homeostasis^{19,20}. PICALM is a genetic risk factor for
86 late-onset Alzheimer's disease that participates in amyloid- β transcytosis and processing
87 of amyloid precursor protein (APP). Human placentas express APP and APP-processing
88 enzymes which are increased in preeclampsia²¹. Oxytocin is a hydrophilic neuropeptide
89 and Pitocin, a synthetic oxytocin, is prescribed in the USA to induce labor and decrease
90 postpartum hemorrhage. The oxytocin receptor (OT-R, *OXTR*) is a magnesium-dependent
91 G protein-coupled receptor²² that activates a phosphatidylinositol-calcium second
92 messenger system²³. OT-R participates in numerous activities ranging from parturition to
93 lactation and mother-child bonding^{22,23}. OT-R functions as a homodimer and in
94 heterocomplexes with vasopressin receptors V1aR (*AVPR1A*)²⁴, V2R, and other
95 receptors. V1aR is the most abundant among vasoactive receptors in human arteries²⁵.

96 Here, among the newly detected partners of VEGFR2 we focused on MDMX and
97 PICLAM based on their documented biochemical functions, and their partners OT-R and
98 V1aR. Finding OT-R in exosome-size clusters in the fetal lumen led to the hypothesis that
99 placental OT-R is carried to the fetus in exosomes, potential transporters of future
100 therapeutic agents. MDMX, PICALM, OT-R, and V1aR protein levels, estimated by
101 western blots and relative to an internal control sample, were associated with clinical
102 characteristics of the 44 patients we studied. Potential insights on the molecular
103 mechanisms of placental MDMX and PICALM were gained, respectively, from the cancer
104 and Alzheimer's disease literature.

105

106 **Results**

107 **Immunoprecipitations (IP).** Key prerequisite for this study was that VEGFR2 protein
108 complexes withstood tissue freezing and extraction by ASB-14. Since Blue-Native
109 electrophoresis (BN) resolves protein mixtures under non-denaturing conditions, we
110 fractionated placental extracts by BN followed by VEGFR2 immunostaining which
111 revealed streaks extending up to 800 kDa. VEGFR2 monomers appear at 220 kDa in
112 western blots. Apparently, ASB-14 stabilized the extracted protein complexes of VEGFR2.
113 Several proteins described in this study were efficiently extracted by ASB-14 (see
114 Methods). New VEGFR2 partners, MDMX and PICALM, were also selected for IP.

115 Fig. 1 shows western blots of the fractions eluted from the magnetic beads and
116 used to select the fraction for mass spectrometric analysis. Representative fractions are
117 identified by the patient's assigned letter-number code shown on Table 1. Magnetic beads
118 retained all of the applied VEGFR2 (**A**) as none was detected in the flow-through fraction,
119 but the MDMX and PICALM antibodies charged on the beads retained only a fraction of
120 their target protein as shown, respectively, in **E** and **F**. All target proteins were greatly
121 enriched in the eluted fraction-E relative to the applied placental extract, fraction-X. OT-R
122 co-immunoprecipitated with MDMX (**G**, right side) and with PICALM (**G**, left side), but not
123 with VEGFR2 (**D**). V1aR co-immunoprecipitated with MDMX (**H**, left side) and with
124 PICALM (**H**, right side), but not with VEGFR2 (**C**). Eluted MDMX appeared smaller in the
125 VEGFR2 IP (**B**) and MDMX IP (**E**), whereas PICALM (**F**), OT-R (**G**) and V1aR (**H**)
126 appeared larger. The size of eluted VEGFR2 was the same as in the extracts (**A**).

127

128

129

130

131

132

133

134

135 **Fig. 1. Protein elution profiles in VEGFR2, MDMX and PICALM IP.** Detergent-extracted
 136 villous sample X was incubated with magnetic bead suspension charged with the target
 137 Ab (see Methods). E denotes eluted protein fractions. Western blots detected the target
 138 proteins eluted in the uniformly performed IP experiments. **A.** VEGFR2 in VEGFR2-IP. **B.**
 139 MDMX in VEGFR2-IP. **C.** V1aR in VEGFR2-IP. **D.** OT-R in VEGFR2-IP. **E.** MDMX in
 140 MDMX-IP. **F.** PICALM in PICALM-IP. **G.** Left-side, OT-R in samples from PICALM-IP, and
 141 right-side OT-R in samples from MDMX-IP. **H.** Left-side, V1aR in samples from MDMX-IP,
 142 and right-side samples from PICALM-IP. Panel **C** shows the membrane in **B** reprobed for
 143 V1aR without stripping.

144

145

146 **Proteomic analysis.** Results of the immunoprecipitations of VEGFR2 (samples O4, O5,
147 O7, U1), MDMX (samples O1, O4, O6, Q1, Q4, R4), and PICALM (samples N3, O1, R4,
148 Q1, Q4, U1) are listed in Tables 2-4. The peptide coverage was not consistent among the
149 placental extracts in each immunoprecipitation group due to different clinical
150 characteristics of the patients whose tissues we tested, and potential differences in post-
151 translational modifications, such as acetylation, and ubiquitination. Soluble proteins in
152 villous homogenates having an affinity for membrane proteins would be retained on the
153 pellets obtained after centrifugation at 100,000g for 1h.

154 **Select proteins that co-immunoprecipitated with VEGFR2 (Table 2).** VEGFR2 was
155 retained on the beads by an Ab raised to the cytoplasmic tail of VEGFR2 exposing
156 extracted proteins to its extracellular, VEGF-binding, domain (see Methods). Therefore,
157 most VEGFR2 partners must have interacted, even after VEGFR2 internalization, with its
158 extracellular rather than its intracellular tyrosine kinase domain, and in binary associations
159 while fewer would bind via some intermediate protein partners. In principle, VEGFR2,
160 MDMX, and PICALM isoforms post-translationally modified at the target sequence of the
161 immunoprecipitating antibodies, are unlikely to be retained on the beads. Our experimental
162 design provided only an estimate of peptide levels in each placental sample. Very basic
163 proteins, such as VEGF-A (pI=9.2), were not detected due to excessive trypsin digestion
164 of these mostly intrinsically disordered proteins prior to mass spectrometric analysis. For
165 example, more than 65% of the VEGF-A residues are expected to be disordered.
166 Nevertheless, western blot analysis showed that VEGF-A co-immunoprecipitated in
167 VEGFR2 IP, and that OT-R (pI=9.6) and V1aR (pI=9.5) co-immunoprecipitated in MDMX
168 and PICALM IP. p53 and MDM2 were detected in IP eluates only by western blots. Under
169 our protocol, proteins larger than 220 kDa were, most likely, identified by peptides from
170 their smaller forms in the placenta.

171 The E3 ubiquitin ligase TRIM21 (tripartite motif-containing protein 21) co-
172 immunoprecipitated with VEGFR2 and in MDMX and PICALM IP (Tables 2-4). TRIM21, a
173 member of the large TRIM family, contains a zinc-binding as well as other motifs. TRIM21
174 is found in the cytosol and nucleus and is unique among all proteins as the highest-affinity
175 Fc receptor in humans²⁶. TRIM21 does not distinguish free from bound antibodies. Another
176 VEGFR2 partner was PDC-E2 (*DLAT*), the E2 component of pyruvate dehydrogenase

177 (Table 2). The association of PDC-E2 with VEGFR2 probably occurs in the nuclei²⁷ and
178 mitochondria, as discussed later, and is shown in the vasculature of the villi (video). Other
179 VEGFR2 partners were complement components (Table 2) revealing complement
180 activation known to occur in placental dysfunctions²⁸. Immunoglobulin heavy constant
181 alpha 1 (*IGHA1*), an autoantibody antigen and signature protein of plasma cells²⁹, was
182 among the large amounts of immunoglobulins detected that are carried by placental
183 endothelial cells³⁰ and maternal blood cells. A smaller than 220 kDa form of the giant
184 protein titin was also detected in VEGFR2 and PICALM IP (Tables 2, 4).

185

186 **Select proteins that co-immunoprecipitated with MDMX and PICALM (Tables 3, 4).**

187 VEGFR2 was not detected in MDMX and PICALM IP, probably because of the limited
188 binding capacity of the MDMX and PICALM antibody charged on the beads. Among the
189 proteins that co-immunoprecipitated with MDMX were PICALM, annexins, arginase-1,
190 RNA-binding protein HNPNA2B1³¹ and others that immunoprecipitated also in VEGFR2
191 and PICALM IP (Tables 2, 4). Protein-glutamine gamma-glutamyltransferase 2 (*TGM2*),
192 which co-immunoprecipitated with MDMX and PICALM (Tables 3, 4), catalyzes protein
193 cross-linking, is considered a bridge between inflammation and hypertension, and is
194 upregulated in preeclampsia³². We indicated in Table 3 the few proteins common in
195 VEGFR2, MDMX and PICALM immunoprecipitations, and many more that co-
196 immunoprecipitated only with MDMX, likely members of the HC proteome. After an initial
197 statistical analysis associated MDMX with the mode of delivery, we were prompted to
198 study the OT-R, which is activated in the myometrium causing uterine contractions²², and
199 its partner V1aR, after validating two commercial antibodies (Figure 10).

200

201 **Immunohistochemistry and whole mount immunofluorescence.** VEGFR2 strongly
202 stained the endothelium of the villous capillaries (Fig. 2A). TRIM21 staining is seen in the
203 cytoplasm of villous trophoblasts and stronger staining in intervillous maternal leukocytes
204 (Fig. 2B, arrows). MDMX is predominantly expressed (Fig. 2, C and D) on Hofbauer cells
205 (HC)³³⁻³⁷ that are targets of Zika and other viruses³⁸. Strong MDMX staining was limited to
206 the cytoplasm of HC, easily identified within the villous stroma, some within stromal
207 channels (Fig. 2C). CD163^{33,39}, a marker for placental macrophages⁴⁰, stained the

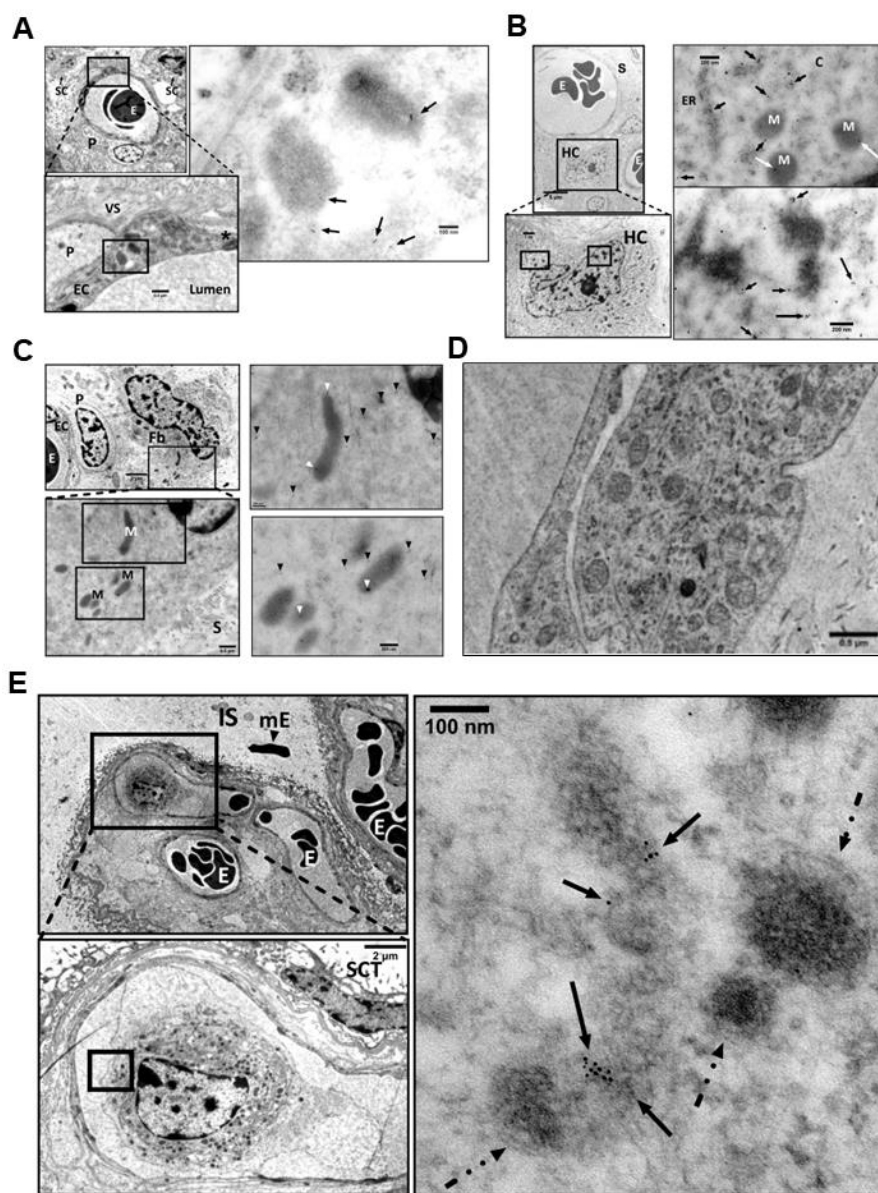

208 cytoplasm of the HC (Fig. 2D). PICALM showed strong staining of trophoblasts and
209 syncytiotrophoblasts (Fig. 2E) and on higher power images (Fig. 2F) positive cytoplasmic
210 staining of the villous capillary endothelial cells was also seen.

211
212 **Fig. 2. Immunohistochemical staining of placental sections.** A. VEGFR2
213 immunostaining is strongly positive in villous endothelial cells (patient Q3). B. TRIM21
214 is uniformly positive in villous trophoblast (patient N4). Very strong staining is seen of
215 maternal leukocytes (arrows). C. MDMX is strongly positive in the cytoplasm of HC and
216 moderately positive in endothelial cells (patient W2). D. CD163 is strongly positive in the
217 cytoplasm of the HC (patient U1). E. PICALM is strongly positive in the trophoblast (patient
218 R4). F. PICALM positivity seen in the villous endothelial cells and fetal blood leukocytes
219 (patient R4). Magnifications in A-F were 10x, 20x and 40x.

220
221 The co-localization of VEGFR2 (red) and PDC-E2 (green) in endothelial cells of the villous
222 vasculature of a normotensive patient is shown on the video obtained from reconstructed
223 stacked images of whole mount immunofluorescence. Nuclei were stained blue with DAPI.

224
225 **Immunogold electron microscopy (IGEM).** VEGFR2 was localized along segments of
226 endoplasmic reticulum, and in mitochondria (Fig. 3). MDMX was localized diffusely within
227 the cytoplasm of an HC and was seen clustering in the nucleus and cytosol. Clusters ran
228 along the nuclear membrane and appeared associated with mitochondrial and
229 endoplasmic reticulum membranes (Fig. 4). PICALM was localized to endothelial cell
230 junctions, along endothelial cell plasma membrane, in cytoplasmic projection into the
231 lumen and adjacent stroma and fetal blood (Fig. 5). OT-R was detected in endoplasmic
232 reticulum and cytoplasmic “peninsulas” of endothelial cells extending into the lumen and
233 on clusters (Fig. 6). V1aR was localized to endothelial cell membrane, nucleus, and
234 stroma. V1aR was also seen on a fetal RBC (Fig. 7). Details are seen in Figures 3-7.

235
236 **Fig. 3. Detection of VEGFR2 by IGEM in chorionic villi of placenta Ho-73**
237 **(preeclamptic).** A. Top left micrograph shows a villous capillary. P: pericyte, E: RBC, SC:
238 stromal cells. Bottom image details area outlined on the top micrograph and shows
239 endothelial cell (EC) cytoplasm, pericyte (P), tight junction (*), collagen fibers in villous
240 stroma (VS), and capillary lumen (L). Image at right: Enlargement of area outlined on the
241 bottom left shows VEGFR2 in mitochondria (arrows). B. Micrograph on top left shows
242 villous capillary, stroma (S), luminal RBC (E), and Hofbauer cell (HC). Enlargement of
243 rectangle at bottom shows prominent nucleolus, mitochondria, and endoplasmic reticulum
244 of HC. Micrographs on the right show enlargement of areas outlined on the bottom left

245 micrograph that detail clusters of VEGFR2 (arrows) in the cytosol (C), along segments of
246 endoplasmic reticulum (ER), and mitochondria (M). Enlargement of image at bottom right
247 shows diffuse localization of VEGFR2 clusters throughout the nucleoplasm (arrows). **C.**
248 Top left micrograph: Villus stroma depicting a fibroblast (Fb), and a pericyte (P) associated
249 with fetal capillary in partial profile, RBC (E), and EC cytoplasm. Bottom left is enlargement
250 of area outlined on the top graph and shows fibroblast cytosol, mitochondria (M), and
251 villous stroma (S). To the right, enlargement of two areas show VEGFR2 in cytoplasm and
252 in partial profiles of mitochondrial matrix (white arrow heads). **D.** A TEM micrograph after
253 osmication provided a better outline of mitochondria in an EC, compared to **A**, **B** and **C**
254 panels. **E.** Fetal capillaries with luminal RBC (E) are shown in the top left image, IS:
255 intervillous space; mE: maternal RBC. Bottom: enlargement of outlined area shows a fetal
256 macrophage in greater detail; a syncytiotrophoblast (SCT) is also present. Right
257 micrograph: enlargement of area in bottom left micrograph, points to VEGFR2 labelling in
258 an incomplete profile of a mitochondrion. Dashed arrows outline the outer double
259 membrane of the labeled and unlabeled mitochondria. The gold particle diameter is 6 nm.

260

261 **Fig. 4. Detection of MDMX by IGEM in chorionic villi of placentas Ho-71**
262 **(normotensive) and Ho-73 (preeclamptic).** A. Left micrograph: Nucleus (N) of
263 endothelial cell (EC) from Ho-73. Arrow heads point to small MDMX clusters, parallel to
264 the inner aspect of the EC plasma membrane. Area outlined, top left: EC junction; P:
265 pericyte process; E: RBC in capillary lumen, S: stroma. This area is enlarged on the top
266 right graph and shows MDMX clusters along the junction (Ju), and endoplasmic reticulum

267 (ER). Bottom right: enlargement of outlined area shows diffuse pattern of MDMX clusters
268 throughout the nucleoplasm. **B.** Top left micrograph shows an outline of apoptotic
269 macrophage in the lumen of fetal capillary (cap) from Ho-71. P: pericyte, F: partial profile
270 of fibroblast (F) and HC partially marked by a white outline. Enlargement on the top right
271 image shows diffuse MDMX localization in the vacuolated cytoplasm of luminal
272 macrophage. Image at bottom left is enlargement of area outlined in white and shows
273 MDMX clustering in the nucleus (N) and cytosol of the HC. Clusters, averaging 50-100 nm
274 in diameter, run along the nuclear membrane and appear to be associated with
275 mitochondrial and endoplasmic reticulum membranes. Bottom right: enlarged area shows
276 MDMX clusters of approximately 100 nm. The gold particle diameter is 6 nm.

277

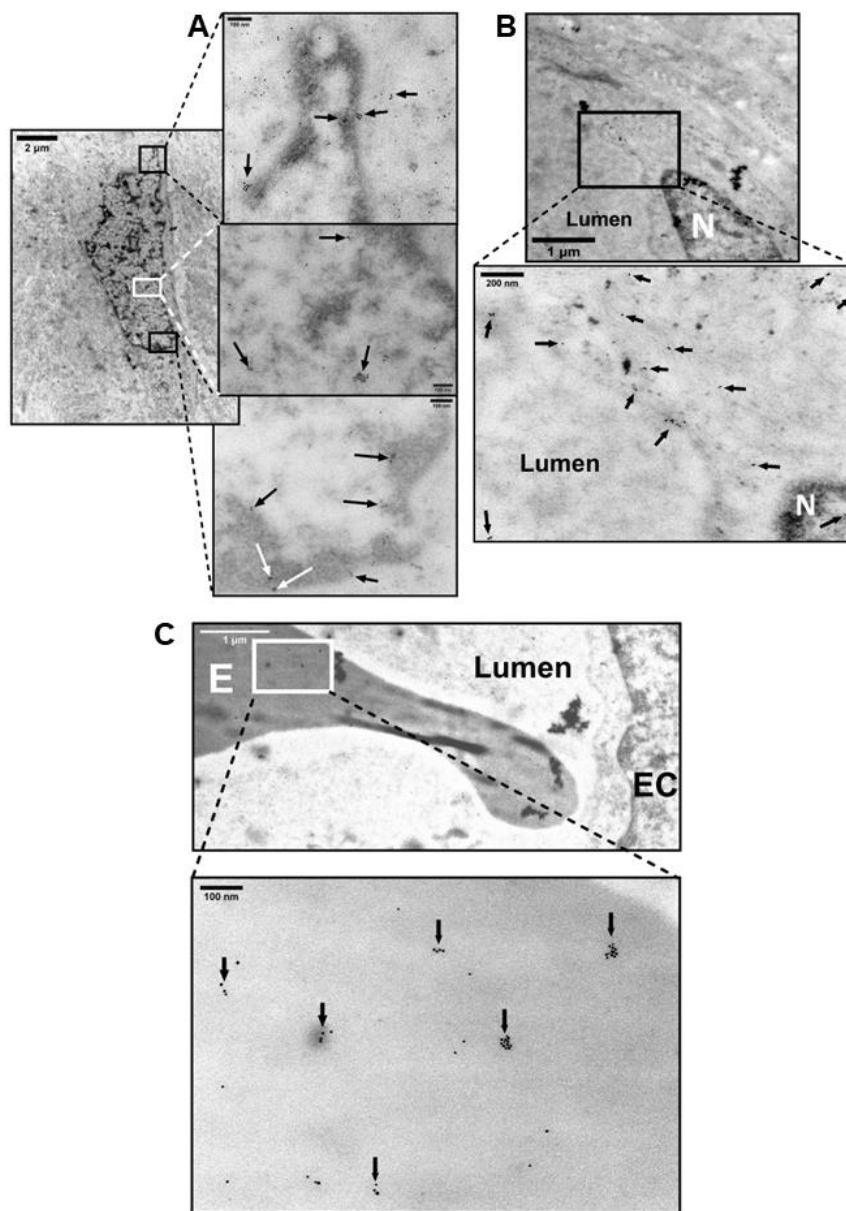

278 **Fig. 5. Detection of PICALM in chorionic villi of placentas Ho-71 (normotensive) and**
279 **Ho-73 (preeclamptic).** **A.** Top IGEM micrograph: partial profile of villus capillary from Ho-
280 71. EC: endothelial cells; E: RBC; stroma. Bottom images: enlargement of two selected
281 areas of endothelium show PICALM localization (arrows) at EC junctions (Ju), along EC
282 plasma membrane, in cytoplasmic projections into lumen (L) and adjacent stroma (S). **B.**
283 Top micrograph: the nuclei of endothelium of a villus capillary from Ho-71, and the adjacent
284 pericyte (P) are patent. Bottom image: enlargement of nucleus, shows PICALM in

285 nucleoplasm near chromatin, on EC cytoplasmic membrane (white arrows) and in luminal
286 space (black arrow). **C.** Top micrograph: HC in stroma of Ho-73. E: RBC in capillary. At
287 bottom: enlargement shows PICALM in HC nucleus (arrows). **D.** Top micrograph: HC cell
288 in the stroma of placenta Ho-71. Bottom image: enlargement shows PICALM in
289 nucleoplasm in association with chromatin. **E.** PICALM is shown (arrows) at the junction
290 (Ju), and plasma membrane of EC and in adjacent stroma (S) of fetal capillary from Ho-
291 73. **F.** PICALM is shown (arrows) in cytoplasm and plasma membrane of EC of capillary
292 from Ho-71, and in basal lamina (BL), stroma (S) and capillary lumen. The gold particle
293 diameter is 10 nm.
294

295
296

297 **Fig. 6. Detection of Oxytocin Receptor (OT-R) in chorionic villi of placentas of**
298 **normotensive Ho-71, and preeclamptic Ho-73 patients.** **A.** Top IGEM micrograph:
299 Villus capillary from Ho-71. P: pericyte adjacent to the endothelial cell (EC); L: lumen.
300 White arrow shows cluster of PICALM on P. Bottom: enlargement shows OT-R in
301 endoplasmic reticulum (ER) and cytoplasm projections of EC into the lumen. (arrows). **B.**
302 Top micrograph: Partial view of villus capillary from Ho73, E: RBC; S: stroma. Bottom
303 graph shows EC junction (J) and OT-R clusters on J, EC cytoplasm, and lumen (arrow).
304 **C.** OT-R is seen in the nucleus of an EC from Ho-73. The gold particle diameter is 10 nm.

305

306 **Fig. 7. Detection of Vasopressin Receptor V1aR in chorionic villus of placenta Ho-**
307 **72 (diabetic).** **A.** Composite IGEM image shows nucleus of HC in stroma on the left and
308 enlargements of three demarcated regions of its nucleus on the right. V1aR clusters, 20-
309 100 nm, in the nucleus are indicated by arrows. **B.** Top micrograph shows EC aspect of a
310 villus capillary. Bottom image is enlargement that shows V1aR on EC membrane, nucleus,
311 and stroma (arrows). **C.** Top micrograph shows aspect of EC of villus capillary; an RBC is
312 seen in the lumen. Bottom image is enlargement that shows several 20-100 nm clusters
313 of V1aR on surface of the RBC (arrows). The gold particle diameter is 10 nm.

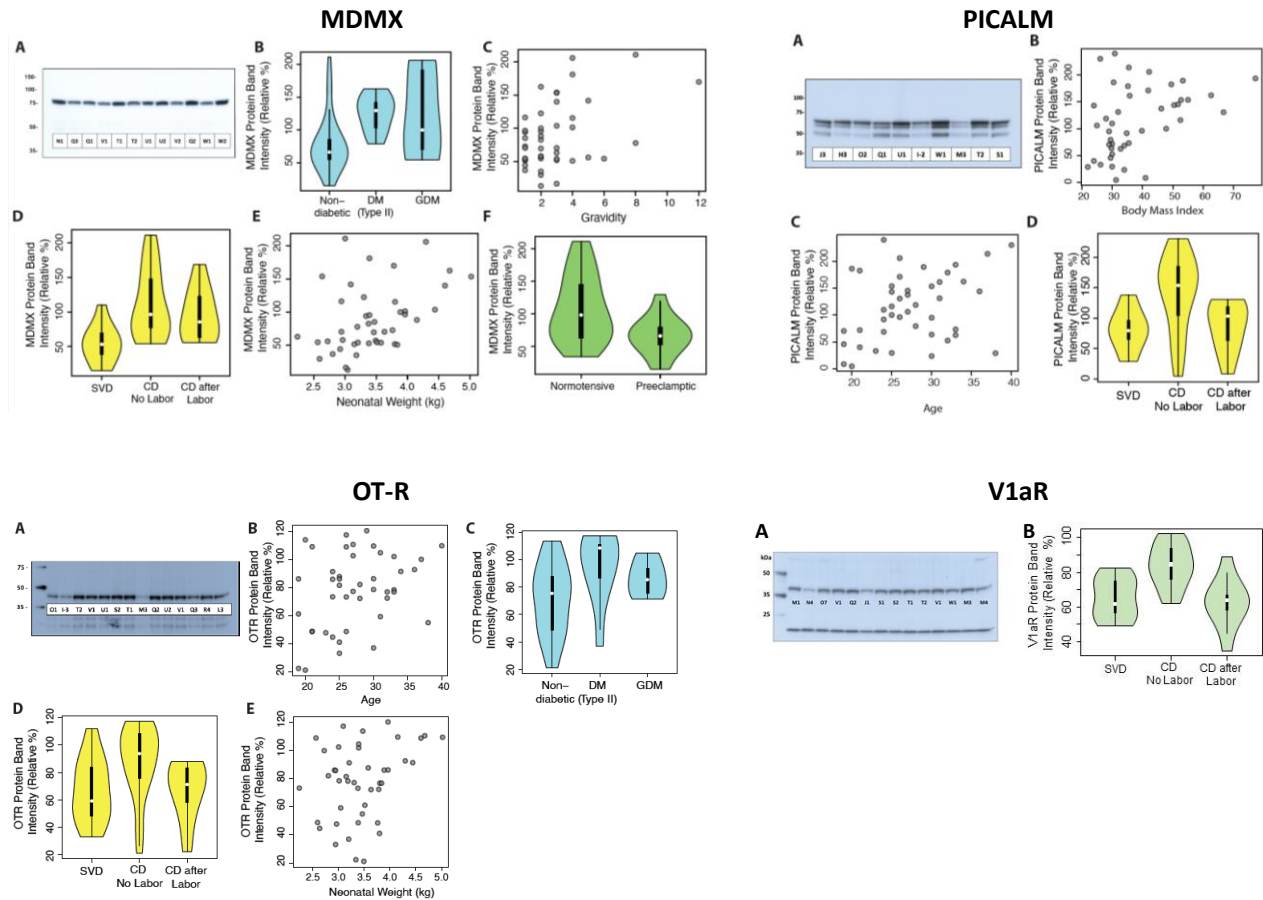

314

315 **Fig. 8. Transmission electron microscopy of osmicated chorionic villus from**
316 **placenta Ho-73 (preeclamptic). A.** An exosome⁹ is shown in the lumen with the
317 characteristic lipid bilayer adjacent to RBC (E). **B.** A dense particle with a lipid bilayer,
318 perhaps an exomere¹², is shown in the lumen next to an RBC (E). Scale in A and B is 50
319 μm .

320

321 **Statistical analysis of protein levels in placental extracts.** To estimate the protein
322 levels of MDMX, PICALM, OT-R and V1aR, we analyzed by western blots 25 µg protein
323 from each of the 44 placental extracts (Table 1). The intensity of the native-protein band,
324 shown at the top of the representative western blots in Fig. 9, is relative to an internal
325 control sample (Q1 or V1) taken as 100% (Table 5). Violin plots show the analysis of the
326 mean protein levels (Fig. 9) among different clinical conditions. Precluded from the
327 statistical analysis were VEGFR2, since its protein levels did not differ significantly among
328 the 44 placentas analyzed in this study, and TRIM21 due to extensive degradation of its
329 native 50-kDa form in our placental extracts.

330

331

332 **Fig. 9. Representative western blots (A) of MDMX, PICALM, OT-R, and V1aR, and**
 333 **violin plots of their relative protein levels associated with diabetes, gravidity,**
 334 **neonatal weight, preeclampsia, BMI, or maternal age, as indicated in B-E. Western**
 335 **blots show the molecular mass (kDa) and the placental extracts identified by a letter-**
 336 **number code shown in Table 1. Internal control for MDMX and PICALM was sample Q1,**
 337 **and sample V1 for OT-R and V1aR.**

338 Next, we performed univariable and multivariable analyses, shown in Tables 6-12,
339 to test whether the mean protein levels of MDMX, PICALM, OT-R and V1aR, represented
340 by western blot band intensity of placental extracts and relative to an internal reference
341 sample Q1 or T1, varied as a function of maternal age, gravidity, gestational age, body
342 mass index, race, preeclampsia, diabetic status, delivery mode, neonatal sex, and
343 neonatal weight. Preeclamptic patients were compared to non-preeclamptic, and diabetic
344 to non-diabetic patients.

345 **Univariable analysis of protein levels.** Protein expression units are the percent values
346 relative to an internal control sample taken as 100% (Table 5).

347 MDMX protein levels were associated with diabetes with an increase of 47.63 units
348 (95% CI 14.27, 90.00) among those with Type II diabetes and 47.91 (95% CI 5.51, 90.32)
349 among those with gestational diabetes mellitus (GDM) compared to those without
350 diabetes, and gravidity with an increase of 9.66 (95% CI 3.59, 15.70) with each unit
351 increase in gravidity, neonatal weight (an increase of 0.03 (95% CI 0.01, 0.06) for each
352 increase in grams), and preeclampsia (-44.13 (95% CI -71.63, -16.64). Regarding the
353 mode of delivery, cesarean delivery, CD, prior to the onset of labor was associated with
354 an increase of 56.16 (95% CI 24.13, 88.18) compared to those with SVD. See Table 6 for
355 full results. Recently, CD163 expression in Hofbauer cells was associated with BMI,
356 gravidity, and fetal birthweight⁴¹.

357 Increased PICALM levels were associated with maternal age with an increase of
358 3.68 (95% CI 0.28, 7.08) in intensity for each year increase, and body mass index with an
359 increase of 2.06 (95% CI 0.66, 3.45) for each unit increase. Regarding the mode of
360 delivery, CD prior to the onset of labor had an increase of 59.96 (19.24, 100.68) compared
361 to those with SVD. See Table 7 for full results.

362 OT-R protein levels were associated with maternal age, an increase of 1.56 (95%
363 CI 0.13, 2.99) for each year of age, and diabetes with an increase of 24.16 (95% CI 5.47,
364 42.85) among those with Type II diabetes compared to those without diabetes. Neonatal
365 weight was associated with an increase of 0.01 (95% CI 8.36×10^{-4} , 0.03) for each increase
366 in grams. See Table 8 for full results.

367 V1aR protein levels were statistically significantly associated with mode of delivery,
368 CD prior to onset of labor 20.36 (95% CI 10.58, 30.13) compared to SVD. See Table 9 for

369 full results. No associations were found for race, neonatal sex, or gestational age between
370 35-42 weeks for any outcome.

371
372 **Multivariable analysis of protein levels.** A multivariable model considered
373 simultaneously all variables that were statistically significant in univariable analysis.
374 MDMX protein levels showed a statistically significant association with gravidity 7.19
375 (95% CI 1.24, 13.14), and preeclampsia -40.61 (95% CI -66.18, -15.04) as shown on Table
376 10. There were no significant associations for PICALM or OT-R as shown in Tables 11-
377 12. The best fit model for V1aR included only an intercept (no covariate).

378 To account for the spread in the replicate measurements of MDMX, PICALM, OT-
379 and V1aR (Table 5), we carried out the bootstrapping analysis shown in Tables 14-19.
380 The statistical results were robust to bootstrapped resampling (n=1000) of data points
381 included in the analyses.

382 We also looked at the correlation of MDMX, PICALM, OT-R and V1aR protein levels
383 with each other and found significant correlations between PICALM and OT-R (0.72 95%
384 CI 0.54, 0.84, $p < 2.7 \times 10^{-8}$), PICALM and V1aR (0.41 95% CI 0.12, 0.63, $p < 0.006$), and OT-
385 R and V1aR (0.47 95% CI 0.20, 0.67, $p < 0.001$). MDMX was not correlated with PICALM,
386 OT-R or V1aR.

387 388 **Discussion**

389 Mass spectrometry placed VEGFR2, MDMX and PICALM and their partners in the
390 molecular landscape of chorionic villi of placentas at term. The co-immunoprecipitated
391 proteins represent the most prevalent and stable complexes. IGEM provided a detailed
392 map of VEGFR2, MDMX, PICALM, OT-R and V1aR in the villi, and hints about protein
393 traffic, specifically, of placental exosomes transporting OT-R to the fetus. In future studies,
394 IGEM can show if two proteins are within 10-20 Å of each other, with secondary antibodies
395 labeled with gold particles of different size⁴², such as 6 nm and 12 nm, even though larger
396 particles may occasionally eclipse the smaller ones.

397 A comprehensive statistical analysis of 44 placental extracts associated MDMX,
398 PICALM, OT-R and V1aR protein levels with labor at term and a number of clinical
399 parameters and gestational complications. Further studies may assign their binary protein

400 interactions into networks of signaling partnerships among patient groups with normal
401 gestation and gestational complications.⁴³ The predominant expression of MDMX on fetal
402 macrophages (HC)³⁷ and the association of MDMX levels in the villi with most of the clinical
403 characteristics we tested, suggest that MDMX has a central role in comorbidities, that
404 originate from deficient trophoblast proliferation,⁴⁴ and are linked to pre-existing conditions
405 and environmental exposures.⁴⁵

406

407 **MDMX immunoprecipitations.** We were puzzled that the immunoprecipitated MDMX had
408 a molecular mass of 50 kDa, instead of 75 kDa in the placental extracts (Fig. 1, B and E).
409 A possible explanation was offered by the discovery⁴⁶ that MDMX interacts with TRPM7,
410 a bi-functional cation channel protein fused with a kinase domain. TRPM7 is a master
411 regulator of the cellular balance of divalent cations, that mediates the uptake of Zn²⁺, Mg²⁺
412 and Ca²⁺,⁴⁷ and senses oxidative stress to release Zn²⁺ from intracellular vesicles⁴⁸.
413 TRPM7 regulates MDMX levels by modulating Zn²⁺ concentration, and induces the
414 formation of faster moving forms of MDMX on SDS-PAGE gels⁴⁶. These forms depend on
415 the channel function of TRPM7 and proteasomal degradation. We hypothesize that
416 placental TRPM7, which is downregulated in preeclampsia,⁴⁹ interacted with MDMX during
417 the overnight incubation with the immunoprecipitation beads stripping MDMX of Zn²⁺.
418 Proteasomal degradation was prevented by including MG-132 in our tissue-extraction and
419 IP buffer. We missed detecting TRPM7 because it did not enter the top section of the 4-
420 12% Bis-Tris NuPAGE gels we used to fractionate the IP proteins with and submit the 25-
421 220 kDa strips for proteomic analysis (see Methods). TRPM7 has a theoretical mass of
422 213 kDa and pI 8.1, but on SDS-PAGE gels it is shown at 230 kDa and was reported at
423 245 kDa in BN electrophoresis.

424

425 **Autoantibody antigens and TRIM21.** Although our patients did not show symptoms of
426 autoimmune diseases, a few of the immunoprecipitated proteins listed on Table 20 were
427 also among the autoantigens detected by Neiman *et al.* in healthy adults⁵⁰, such as the
428 extensively studied autoantigens TRIM21/Ro(SS-A) and PDC-E2, also an autoantigen in
429 primary biliary cholangitis and other autoimmune diseases. PDC-E2 would be held on the
430 beads as a partner of VEGFR2. TRIM21 is also extracted from intervillous maternal

431 leucocytes based on their staining with TRIM21 (Fig. 2B). Maternal autoantigen-
432 autoantibody complexes, with an affinity for proteins in the villous membrane fraction,
433 would be trapped on the beads by Fc-receptor TRIM21 based on its high affinity for IgG²⁶.
434 Since TRIM21 has broad species specificity, it could bind to the sheep anti-rabbit Ab on
435 the Dynabeads and the IP-bait, the anti-rabbit Ab the beads were charged with. If TRIM21
436 clusters on the beads remain catalytically active, they could, in principle, retain VEGFR2,
437 MDMX and PICALM, as substrates of ubiquitin ligases, along with other proteins, many
438 not *in vivo* TRIM21 substrates, detected by mass spectrometry. Consequently, TRIM21
439 can confound immunoprecipitations, performed according to our protocol, by retaining
440 proteins unrelated to the bait-Ab. Based on the extensive TRIM21 literature, placental
441 TRIM21 could participate in metabolic pathways as an E3 ubiquitin ligase,^{51,52} and as Fc
442 receptor defending against infections.

443

444 **Immunohistochemistry and immunogold electron microscopy.** The distribution of
445 VEGFR2, MDMX and PICALM in the villi was shown by IHC (Fig. 2) and by IGEM which
446 also showed the distribution of OT-R and V1aR (Figures 3-7). VEGFR2 was detected in
447 the nucleus, as previously reported^{27,53}, and in mitochondria, a novel observation to the
448 best of our knowledge (Fig. 3, panels A, B and C). Translocation in the other direction,
449 mitochondria to the nucleus, was shown for the entire pyruvate dehydrogenase complex
450 to supply acetyl-CoA for histone acetylation⁵⁴. VEGFR2 is distributed through relay
451 networks in lipid rafts and endosomal trafficking⁵⁵ and SUMOylation holds VEGFR2 at the
452 traffic control Golgi apparatus⁵⁶. Gradients in receptor concentration may exist along the
453 placental vascular tree, as was shown for the purinergic P2Y₂ receptor (pI=9.7)⁵⁷.
454 Distortion of receptor gradients in preeclampsia and diabetes could affect protein traffic
455 and even expose proteins to degradation. Regarding the latter, it may be pertinent to
456 consider the mechanism of action of estrogen receptor antagonists that decreased the
457 estrogen receptor intra-nuclear mobility and subsequently induced its turnover⁵⁸.

458 MDMX appeared in nuclear clusters (Fig. 4, A and B). PICALM was detected in
459 nuclei (Fig. 5, B and C). The very basic OT-R and V1aR were also detected (Figures 6
460 and 7). Surprisingly, clusters of V1aR became clearly visible on a fetal RBC after
461 increasing gamma (Fig. 7, C). Since vasopressin receptors participate in erythropoiesis⁵⁹

462 their presence on RBC was not very surprising. We hypothesize that in addition to non-
463 traditional functions, such as critical immune sensors,⁶⁰ RBC transport V1aR to the
464 endothelial cells of the villi²⁵.

465 PICALM and OT-R were detected on endothelial cell projections into the fetal lumen
466 (Figures 5A, 6A) where OT-R clusters were also observed (Fig. 6, A and B) matching the
467 dimensions of microvesicles-exosomes^{10,11}. Although we cannot prove that OT-R clusters
468 are inside exosomes with the characteristic bi-lipid membranes, as seen in standard EM
469 cellular morphology, we propose that fetal exosomes carry to the fetus the OT-R and other
470 proteins produced in the placenta. A limitation of IGEM, from the exosome perspective, is
471 that bi-lipid layers are greatly impaired during the processing of tissues because OsO₄ is
472 omitted in a post-fixation step used to increase the visualization of such membranes. OsO₄
473 reacts strongly with lipid complexes, and while it enhances contrast for standard EM cell
474 morphological imaging, it can oxidize many antigen epitopes in IGEM. Fig. 8 shows
475 representative intraluminal vesicles⁹ seen in the fetal capillary of the placenta sample that
476 was processed with the OsO₄ post-fixational step included. Membranes are more clearly
477 defined here, compared to the IGEM sample, representing exosomes or microvesicles⁹ in
478 the fetal lumen (Fig. 8, A and B). We noticed similarities between our IGEM Figures 5 and
479 6 and transmission electron microscopy images in a study at two polluted cities in Mexico
480 showing that environmental nanoparticles of Fe, Ti, Cu, Hg and Sn accumulated in HC
481 and endothelial cells of chorionic villi sampled at term⁶¹.

482
483 **Statistical analysis of protein levels and clinical presentations.** Our search for the
484 function of the newly detected placental membrane proteins MDMX, PICALM, and of OT-
485 R and V1aR, was accelerated by a statistical analysis of their protein levels, which
486 revealed numerous associations with clinical characteristics of the 44 patients. MDMX,
487 located predominantly in HC (Fig. 2C), took center stage based on its association with
488 most of the clinical characteristics we tested. Although many of our statistical associations
489 from 44 placentas are highly unlikely to be observed by chance, our conclusions could
490 change by testing a larger number of placenta samples and integrating, after further
491 research, protein isoforms and post-translational modifications of the newly detected
492 proteins. But to what extent did proteins from intervillous blood, reflecting also the maternal

493 immune system,⁴⁵ contribute to the observed clinical associations? An initial answer was
494 provided for MDMX by the statistical analyses showing that tissue-resident HC contributed
495 most extensively since they predominantly express MDMX (Fig. 2).

496
497 **Diabetes.** In diabetic patients, higher MDMX levels (Table 6) seem to correspond to the
498 higher number of cells stained with CD163⁶², a marker of HC³⁹. It is not known if MDMX
499 upregulation and higher HC numbers mark a metabolic shift towards diabetes. A diabetic
500 atherosclerosis rat model showed upregulation of MDMX mRNA and protein levels⁶³.
501 MDMX was shown in cell cultures to serve as a nutrient sensor by inhibiting mTORC1⁶⁴.
502 HC could facilitate nutrient transportation in the villous stroma³⁴ linking placental MDMX to
503 nutrient levels and metabolic networks. OT-R levels are higher in Type 2 diabetes (Table
504 8), and there is an association of *OXR* variants with insulin sensitivity and Type 2
505 diabetes⁶⁵.

506
507 **Preeclampsia.** Villous trophoblasts in pregnancies complicated by preeclampsia had
508 higher p53 and lower MDM2 levels¹⁸. Although MDMX was not measured, we believe it
509 would have been decreased also. Lower MDMX levels (Tables 6, 10) could reflect the
510 decreased numbers of HC in preeclampsia^{40,41}. What can cause the decrease of HC? In
511 cancer, abnormal vascularity disrupts the penetration of immune cells,⁶⁶ and their function
512 is hindered by the tumor microenvironment^{67,68}. Here, defective placental vascularity and
513 increased placental stiffness⁶⁹, both changing the architecture of the villi, could have an
514 adverse effect on HC levels. In preeclampsia, placental stiffness could be increased by
515 higher levels of tissue transglutaminase/*TGM2* (Tables 3, 4) which catalyzes protein
516 crosslinking³². MDMX could be involved in the reprogramming of fetal macrophages (HC)
517 during preeclampsia and other gestational complications and labor. Drawing from the
518 breast cancer literature⁷⁰, downregulation of placental MDMX in preeclampsia could be
519 linked to estrogen receptor- α ⁷¹ and lower estrogen levels^{72,73}.

520 In preeclampsia large quantities of magnesium sulfate are prescribed to prevent
521 seizures. A potentially relevant study of a blood-brain barrier (BBB) model of primary
522 endothelial cells from human brain⁷⁴, showed that TRPM7 mediated the entry of
523 extracellular Mg²⁺ into cells and that high Mg²⁺ levels speeded up the clearance of A β to

524 the blood side via BBB transcytosis and upregulation of PICALM and LRP-1 that is also
525 expressed in HC⁷⁵. It was shown recently that TRPM7 kinase activity induces amyloid- β
526 degradation and clearance⁷⁶. Among other mechanisms, the accumulation of placental
527 A β ²¹ could be related to TRPM7 and limiting PICALM-dependent transcytosis.

528
529 **Gravidity.** Univariable and multivariable regression analysis found a significant
530 association of gravidity with MDMX levels (Tables 6, 10). Gravidity was recently associated
531 with HC levels determined by CD163 immunostaining⁴¹. While multigravida women have
532 shorter telomeres and increased DNA methylation age,⁷⁷ a role of p53 and MDMX on
533 telomere length is not established in normal human tissues, to the best of our knowledge.
534 DNA methylation age is associated with MDMX and prenatal smoke exposure⁷⁸. The
535 gravidity-MDMX association, which registers in the villi, could reflect the cost of multiple
536 pregnancies to the mother⁷⁹.

537
538 **PICALM, OT-R and V1aR.** The association of placental PICALM levels with BMI (Table
539 7) is intriguing because the placenta functions in the absence of adipocytes. A potential
540 precedent for such association was provided by a study on gastric bypass surgery where
541 PICALM mRNA levels in the blood were decreased after a significant drop of BMI⁸⁰.
542 Furthermore, among the Alzheimer's risk nucleotide polymorphisms (SNP), a PICALM
543 SNP is associated with obesity⁸¹.

544 The strong correlation of protein levels of PICALM with OT-R ($p < 2.7 \times 10^{-8}$), PICALM
545 with V1aR ($p < 0.006$), and OT-R with V1aR ($p < 0.001$) point to fundamental interactions by
546 yet unknown mechanisms. MDMX was not correlated with PICALM, OT-R or V1aR.

547 Downregulation of OT-R in spontaneous vaginal deliveries (SVD) relative to CD
548 prior to the onset of labor (Table 8), would be consistent with the higher oxytocin levels in
549 SVD than CD. It is not known to what extent extravillous blood cells and exosomes may
550 have supplied OT-R, and V1aR, detected in placental membrane extracts. Nevertheless,
551 IGEM images of the chorionic villi support the hypothesis that the lipid-covered exosomes
552 carry a cargo of the very basic, magnesium-dependent OT-R across the blood-brain
553 barrier to interact also with fetal microglia⁸²⁻⁸⁴, the resident immune cells of the brain⁸⁵. OT-
554 R protein levels in venous and arterial blood from the umbilical cord may reveal differences

555 in bi-directional OT-R traffic in normal, preterm and postterm deliveries. In that case, OT-
556 R protein levels and epigenetic modifications⁸⁶ may lead to therapeutic interventions with
557 exosomes⁸⁷ prepared, ideally, with the transmembrane orientation¹² of OT-R in villous
558 exosomes.

559
560 **Labor.** The decrease of MDMX in the membrane fraction of chorionic villi in SVD vs. CD
561 prior to the onset of labor (Table 6), could be related to the decrease of immune cells in
562 peripheral maternal blood with approaching labor⁸⁸, and the molecular signature of the
563 “immune clock”.^{45,89} Lower MDMX levels could also indicate a molecular switch in late
564 gestation, locally, to energy-preserving measures or other mechanisms involving uterine
565 macrophages⁹⁰. MDMX, PICALM, OT-R and V1aR could be components of the fetal and
566 maternal immune system during pregnancy and as the fetus develops immunity in
567 preparation for birth.^{91,92} Concomitant downregulation of MDMX, PICALM, OT-R and
568 V1aR occurred only in SVD compared to CD prior to the onset of labor (Tables 6-9)
569 signifying a potential convergence of metabolic networks to prepare the uterus for the final
570 act in pregnancy, delivery of the fetus.

571

572 **Materials and methods**

573

574 **Human Subjects.** All patients signed consent forms prior to their inclusion in the study
575 according to the protocol approved by the Institutional Review Board of the University of
576 South Florida and Tampa General Hospital. Placental samples were obtained from 44
577 patients with singleton pregnancies, aged 19-40 and gestational ages ranging from 35-42
578 weeks based on the dating criteria from the American College of Obstetricians and
579 Gynecologists (ACOG) (<https://pubmed.ncbi.nlm.nih.gov/28426621/>) for women who
580 delivered vaginally or by cesarean delivery (CD), between 7 AM to 4 PM, based on
581 obstetric indications (Table 1). Patients were excluded if they had active viral infections or
582 fetal growth restriction, defined as estimated fetal weight of <10th% per the Hadlock growth
583 curve. Preeclampsia was diagnosed according to the criteria established in 2013 by ACOG
584 (DOI: [10.1097/01.AOG.0000437382.03963.88](https://doi.org/10.1097/01.AOG.0000437382.03963.88)). Low risk pregnancy was defined by the
585 absence of maternal co-morbidities including chronic hypertension defined as

586 hypertension prior to pregnancy or systolic blood pressure ≥ 140 mm Hg or diastolic blood
587 pressure ≥ 90 mm Hg prior to 20 weeks' gestation, pregestational or gestational diabetes,
588 smoking, renal disease, and autoimmune disease. Patients with preeclampsia with severe
589 features defined by the 2013 ACOG Guidelines received magnesium sulfate for seizure
590 prophylaxis during induction of labor or CD through 24h postpartum. The demographic
591 Table 21 shows that 91% of study participants were 18-34 years old and 75% were
592 multiparous. Most participants (91%) were ≥ 37 weeks' gestation. There was no risk of
593 bias in the selection of placentas which was at random. Sample/patient IDs (e.g., H-1,
594 J-1, etc.) are not known to anyone outside the research group, and are assigned
595 identifiers not using any personally identifiable information.

596
597 **Reagents.** Most of the reagents were purchased from Thermo Fisher Scientific
598 (Waltham, MA, USA), MMP-200 metalloprotease inhibitor III, proteasome inhibitor
599 MG-132, protease inhibitor cocktail III, marimastat, Hammarsten-grade casein, detergent
600 ASB-14, Novagen S-protein HRP conjugate 69047-3, Novex 4-12% BT SDS-PAGE
601 gels, CL-XPosure film, magnetic Dynabeads M-280 charged with sheep anti-rabbit
602 antibodies, Maxisorp Nunc C-bottom 8-well strips, protein assay Pierce BCA 562 nm kit
603 23225 (Pierce, Rockford, IL), and Protein Perfect HRP MW markers 69079-3/
604 Millipore-Calbiochem (Billerica, MA). Additional reagents are provided in the sections
605 below.

606
607 **Antibodies (Protein target/vendor).** VEGFR2 (55B11) no. 2479/Cell Signaling
608 (Danvers, MA), MDMX A300-287A/Bethyl Laboratories (Montgomery, TX),
609 PDC-E2 SC-365276/Santa Cruz Biotechnology (Santa Cruz, CA), PICALM
610 Sigma Prestige HPA019053, OT-R ABN1735/Millipore (Temecula, CA), V1aR
611 MBS176788/MyBiosource (San Diego, CA), CD163 MA5-33091/InVitrogen-Thermo
612 Fisher Scientific, TRIM21 Novus NBP1-33548 (Centennial, CO), Alexa-488 (green)
613 and Alexa-64 (red) goat anti-rabbit/mouse conjugated secondary antibodies/Life
614 Technologies (Eugene, OR), immunogold donkey-anti-rabbit secondary antibodies
615 25702 (6 nm) and 25705 (10 nm) (Electron Microscopy Sciences (Hatfield, PA).

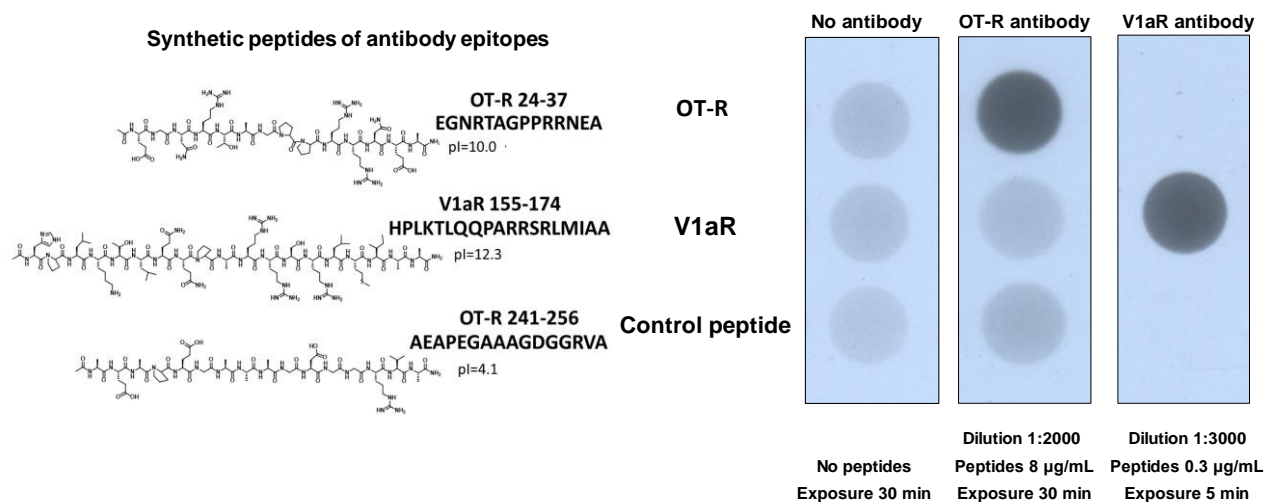

616
Placenta tissue collection, homogenization, and protein extraction with ASB-14

Within 15 min of the delivery of the placenta,³⁰ samples were obtained from the fetal side of
the placental bed at 4-5 cm from the umbilical cord and were placed on dry ice and then

617 stored at -80°C. Tissues were also fixed in formalin for IHC or in paraformaldehyde-tannic
618 acid for IGEM. Frozen tissue samples were finely cut and placed, at 150 mg per mL, in
619 homogenization buffer containing 50 mM sodium phosphate pH 7.6, 50 mM NaCl, 50 µM
620 sodium o-vanadate, 10 mM NaF, 20 µM proteasome inhibitor MG-132, 10 µM marimastat
621 and 6 µL protease inhibitor cocktail-III per mL. After homogenization at 4°C by three 15s
622 bursts of a homogenizer with one-minute cooling in between, the homogenates were
623 centrifuged for 1h at 100,000g. On top of the pellets was a thin pink fluffy layer, presumably
624 of RBC membranes, which was included when the pellets were suspended in
625 homogenization buffer containing 1% ASB-14 and then extracted overnight, due to
626 logistical reasons, at 6-8°C by end-over-end rotation. The zwitterionic detergent ASB-14
627 was superior in solubilizing membrane proteins to CHAPSO or n-octyl β-D-maltoside. After
628 centrifugation at 100,000g for 1h, the supernatant solution was used in
629 immunoprecipitations and western blots. We refrained from washing the membrane pellets
630 in order to capture weak protein complexes. Protein levels of the membrane extracts were
631 determined in quadruplicate at two dilutions with the Pierce BCA 562 nm kit. Final yield:
632 10-15 mg of detergent-extracted proteins per g wet tissue. To determine the efficiency of
633 protein extraction by ASB-14, the post-ASB-14 100,000g pellets were solubilized in SDS-
634 DTT at 95°C and then probed in western blots. Extraction yield was 100% for VEGFR2,
635 MDMX and PICALM, 86% for PDC-E2 and 64% for TOMM20, a marker for inner
636 mitochondrial membranes.

637
638 **Peptide synthesis to validate the OT-R and V1aR antibodies.** Fig. 10 shows OT-R
639 peptides EGNRTAGPPRRNEA (within the OT-R immunogen range given for this
640 antibody), AEAPEGAAAGDGGRVA (outside the OT-R immunogen range) and V1aR
641 immunogen peptide HPLKTLQQPARRSRLMIAA to validate the OT-R Millipore ABN1735
642 (0.5 µg/µL) and V1aR MyBioSource MBS176788 (0.5 µg/µL) antibodies. The peptides
643 were synthesized on 100 mg Rink Amide-MBHA resin (0.65 mmol/g) at room temperature
644 under air using standard solid phase peptide synthesis protocol.

645

646

647 **Fig. 10. Validation of OT-R and V1aR antibodies.** The synthesized peptides and their pI
648 are shown next to the scans of the coated Nunc C-bottom strips probed with the antibodies
649 being validated.

650 **Validation method for OT-R and V1aR antibodies.** Maxisorp Nunc C-bottom strips were
651 coated overnight at 4°C with the indicated amounts of synthetic peptides (Fig. 10)
652 dissolved in sodium carbonate buffer pH 9.6⁹³. After blocking, as in western blot
653 experiments, the OT-R and V1aR antibodies were added for 2h at room temperature at
654 the indicated dilution followed by the secondary anti-rabbit antibody conjugated with
655 horseradish peroxidase. Detection of bound OT-R or V1aR antibodies was conducted by
656 ECL on films exposed for the indicated times. The OT-R and V1aR antibodies bound only
657 to peptide sequences used to raise them.

658

659 **Immunoprecipitations.** Each immunoprecipitation of the 4-6 placental extracts, shown in
660 Table 3-5, was carried out in one batch. Half mL of pellicular support M-280 Dynabeads
661 was washed in homogenization buffer containing 1% ASB-14 and charged separately at
662 room temperature for 2h with 0.9 µg VEGFR2, 15 µg MDMX or 7.5 µg PICALM antibody.
663 Three mg of ASB14-extracted placental membranes from each placenta were mixed
664 separately with the beads, overnight for logistical reasons, at 6-8°C. Most proteins
665 adhering to the beads were removed by washing four times with homogenization buffer

666 containing 1% ASB-14 and once with detergent-free buffer. Bound proteins were eluted at
667 95°C with 100 mM Tris-HCl pH 7.6, 4% SDS (w/v) and 100 mM DTT. Eluted proteins were
668 fractionated on 4-12% Bis-Tris NuPAGE gels. After Coomassie blue staining, gel strips
669 from 25-220 kDa were submitted for mass spectrometric analysis.

670

671 **Mass spectrometry.** Samples were submitted and analyzed in a double-blinded fashion.
672 Immunoprecipitated proteins were digested with Trypsin/Lys-C overnight at 37°C as
673 described⁹⁴. Each group of immunoprecipitated samples was analyzed with a new trap
674 and HPLC column. Peptides were dried in a vacuum concentrator and resuspended in
675 0.1% formic acid for LC-MS/MS analysis. Peptides were separated with a C18 reversed-
676 phase-HPLC column on an Ultimate3000 UHPLC with a 60-min gradient and analyzed on
677 a Q-Exactive Plus using data-dependent acquisition. Raw data files were processed in
678 MaxQuant (www.maxquant.org) and searched against the UniprotKB human protein
679 sequence database. Search parameters included constant modification of cysteine by
680 carbamidomethylation and the variable modification, methionine oxidation. Proteins were
681 identified using the filtering criteria of 1% protein and peptide false discovery rate.

682

683 **Western blot analysis.** 25 µg of protein from placental extracts were resolved on 4-12%
684 Bis-Tris NuPAGE gels, transferred to PVDF membranes and blocked overnight at room
685 temperature in 1% Hammarsten-grade casein or 5% Difco skimmed milk powder. MDMX,
686 PICALM, OT-R or V1aR primary antibody dilutions ranged from 1:800 to 1:10000. PVDF
687 membranes incubated with ECL reagents were exposed to film for 1-20s. Films were
688 scanned in the transmittance mode (Epson Perfection 3200 Photo, Epson America, Los
689 Alamitos, CA, USA). The intensity of the top band (Fig. 9) was measured with Li-Cor Image
690 Studio Lite software (Lincoln, Nebraska, USA) and chosen from a film exposed at the linear
691 portion of the correlation between band intensity and film exposure time before films were
692 overexposed. In the statistical analyses we used the mean intensity from 3.6 blots, on the
693 average, and relative to an internal control sample Q1 or V1 (Table 5).

694

695 **Immunohistochemistry.** 4 µm formalin-fixed paraffin embedded tissue sections were
696 processed for IHC and stained with VEGFR2 (1:50), MDMX (1:500) or PICALM (1:1000)

697 antibodies. Slides were exposed with diaminobenzidine tetrahydrochloride dehydrate as a
698 chromogen and counterstained with hematoxylin before permanent mounting.

699
700 **Immunogold electron microscopy.** Tissue samples were promptly fixed in buffered 4%
701 paraformaldehyde and kept overnight at 4°C and then immersed in 0.75% buffered
702 solution of tannic acid for 2h at room temperature. Samples were rinsed in filtered glass-
703 distilled water, dehydrated through a series of increasing ethanol concentration, infiltrated,
704 and embedded in LRW acrylic resin. Selected blocks were sectioned at 90-100 nm and
705 mounted on formvar coated copper grids. The immunogold reaction was performed by
706 incubating grids in standard blocking solution for 30 min at room temperature and
707 transferring to either 1:100 MDMX rabbit Ab, 1:400 PICALM rabbit Ab, 1:100 VEGFR2
708 rabbit Ab or 1:600 OT-R or V1aR rabbit Ab for an overnight incubation at 4°C. After
709 washing in PBS, gold-conjugated donkey anti-rabbit Ab 25703 (Electron Microscopy
710 Sciences, Hatfield, PA), was applied at 1:50 dilution for 90 min at room temperature. The
711 diameter of the gold particles (Electron Microscopy Sciences, Hatfield, PA) was 6 nm in
712 VEGFR2 and MDMX and 10 nm in PICALM and OT-R experiments. Excess secondary
713 antibody was removed by washing with glass-distilled water and the grids were further
714 treated with 2% aqueous uranyl acetate added for contrast. In control experiments
715 excluding the primary antibody, 1-2 gold particles were detected throughout the grids. In
716 morphological analysis by transmission electron microscopy, tissues were fixed in 2%
717 OsO₄, after 2.5% glutaraldehyde fixation and prior to the dehydration and resin infiltration
718 steps. Images were obtained with a JEM-1400 transmission electron microscope (JEOL,
719 Peabody, MA) and Orius-832 camera (Gatan Inc., Pleasanton, CA).

720
721 **Whole mount immunofluorescence (WMIF).** Small samples (2x2x2 mm) of placental
722 tissues ,were fixed in 1 mL 90% methanol for 2h at 4°C according to Bushway et al.⁹⁵ with
723 modifications. After washing with PBS, the samples were blocked for 2h at 4°C with 1%
724 Hammarsten-grade casein in PBS containing 0.02% Thimerosal. After washing with 0.5%
725 Casein in PBS, antibodies to VEGFR2 and PDC-E2 were added at 1:400 dilution and
726 incubated overnight at 4°C, followed by washing with 0.5% Casein-PBS containing 0.3%
727 Triton-X and incubation with the secondary antibodies at 1:100 dilutions. WMIF slides were

728 observed with a Leica TCS SP5 AOBS laser scanning confocal microscope through a
729 40X/1.3NA Plan Achromat oil immersion objective lens (Leica Microsystems CMS
730 GmbH, Germany). 405 Diode, Argon 488 and He-Ne 647 laser lines were applied to excite
731 the samples and tunable emissions were used to minimize crosstalk between
732 fluorochromes. Images were captured with photomultiplier detectors and prepared with the
733 LAS AF software version 2.7 (Leica Microsystems CMS GmbH, Germany). A 3D projected
734 image was created by Z-stack of images taken at 1.0-0.5-micron intervals to create a
735 movie by Imaris version 7.6 (Bitplane AG, Switzerland) (video).

736
737 **Statistical analysis.** The protein levels of MDMX, PICALM, OT-R and V1aR were
738 analyzed for univariable and multivariable associations by linear regression using the R
739 statistical program (<https://www.r-project.org>, 4.1.3). Parsimonious multivariable models
740 were selected using Akaike's Information Criteria with a stepwise selection procedure
741 (StepAIC in the MASS package of R) and were run with covariates that were identified as
742 statistically significant in univariable analysis. A p-value of less than 0.05 was considered
743 statistically significant. Violin plots were made by R statistical program, and data Figures
744 and graphs were assembled using Fiji ImageJ, GraphPad Prism 9.4.0, Adobe Illustrator
745 and Windows Office365 software. To test the robustness of results to the specific
746 datapoints included in the analysis, bootstrapped resampling (with replacement) was used
747 to generate 1000 replicate datasets, upon which regression analyses were redone.
748 Results of bootstrapped resampled analyses were summarized and compared to the full
749 dataset to characterize consistency of point estimates and patterns of statistical
750 significance. Pearson correlation coefficients were used to characterize correlation of
751 protein measurements with each other.

752
753 **Acknowledgements**
754 This study was supported by the Department of Obstetrics and Gynecology at the
755 University of South Florida and research funds from Tampa General Hospital (AEA) and
756 the Teasley Foundation (TJR). The WMIF images were obtained by the Analytic
757 Microscopy Core Facility at the H. Lee Moffitt Cancer Center & Research Institute, an NCI
758 designated Comprehensive Cancer Center (P30-CA076292). We thank Umit A. Kayisli for

759 advice on IHC, and Santo V. Nicosia and Greg Arsenis for reading the manuscript and
760 comments.

761
762 **Author contributions**
763 JCMT conceived the study, performed most wet chemistry experiments, and wrote the first
764 draft of the manuscript in consultation with VNU and RRM. SJH, RGS, and EPN recruited
765 patients, collected, and interpreted clinical data in consultation with TSS, TJR, AEA, and
766 MLA. DC performed proteomic analyses. MO assisted in the analysis of western blot data
767 and confocal and WMIF experiments. SA and NS performed IHC experiments. AG
768 performed and interpreted IGEM. PS and JC synthesized OT-R and V1aR peptides. DATC
769 performed analyses and statistical data presentation. All authors critically read and
770 approved the manuscript.

771
772 **Competing interests**
773 DATC declares a grant from Merck for research unrelated to this manuscript. The
774 remaining authors declare no competing interests.

775
776 **Data availability**
777 The video of the chorionic villi is deposited at

Table 1.

Clinical characteristics of 47 patients in the study group.

A. Patient samples were labelled with a code consisting of a letter and 1, 2, 5, 6, 7 for non-preeclamptic, 3, 4 for preeclamptic patients or a Ho-number. **B.** Patients Ho-71, Ho-72 and Ho-73 provided placental samples for immunogold electron microscopy.

Abbreviations: *Race*: White 1, Black 2, Asian 3, Hispanic 8, unknown 6. *Chronic hypertension*: cHTN 1. *Preeclampsia* 1. *Diabetes (DM)*: Type-1 1, Type-2 2, Gestational 3. *Delivery mode*: Spontaneous vaginal delivery (SVD) 1, Cesarean delivery (CD) prior to the onset of labor 2, CD after the onset of labor 3, Vaginal birth after CD (VBAC) 4. *Pitocin pre-delivery* 1. *Fetal sex*: Female 1, Male 2. *L&D*: Labor and delivery suite. *NA*, not available. The number of patients in each category were as follows: Diabetes: 30 no, Type-2 9, Gestational 5. Preeclampsia: 28 no, 16 yes. Delivery Mode: SVD 12; CD prior to the onset of labor 23; CD after the onset of labor 9; VBAC 1.

Table 2

Proteins identified in VEGFR2 immunoprecipitations.

Placental extracts O4, O5, U1, and O7 were immunoprecipitated in one experiment.

Majority Protein ID	Protein	Gene	Total Intensity	Intensity VEGFR2 O4	Intensity VEGFR2 O5	Intensity VEGFR2 U1	Intensity VEGFR2 O7	Peptides
P01857	Ig gamma-1 chain C region	IGHG1	24,993,000,000	8,554,400,000	4,872,000,000	4,017,600,000	7,549,400,000	16

Table 5
Protein levels of MDMX (A), PICALM (B), OT-R (C) and V1aR (D) in 44 placental extracts.
 MDMX and PICALM values are relative to extract 01, and OT-R and V1aR values relative to sample V1. Replicate and mean values are shown.

Table 20

Autoantigens listed by Neiman et al. among the proteins in VEGFR2, MDMX, and PICALM immunoprecipitations (IP).

	Uniprot	Gene	Protein name	Autoimmune disease	
VEGFR2 IP	P01023	A2M	Alpha-2-macroglobulin (Alpha-2-M)	Sjögren's syndrome	
	E7EVS6	ACTB	Actin, cytoplasmic 1 (Beta-actin)	Autoimmune hemolytic anemia	
	P07355	ANXA2	Annexin A2 (Annexin II) (Annexin-2)	Antiphospholipid syndrome	
	P08758	ANXA5	Annexin A5 (Anchorin CII)	Antiphospholipid syndrome	
	P11182	DBT	Lipoamide acyltransferase BCOADC-E2	Primary biliary cholangitis	
	P17661	DES	Desmin	Sjögren's syndrome	
	P10515	DLAT	PDC-E2	Primary biliary cirrhosis	
	Q02413	DSG1	Desmoglein-1	Pemphigus foliaceus	
	P19474	TRIM21	E3 ubiquitin-protein ligase TRIM21	Sjögren's syndrome; Systemic Lupus Erythematosus	
	Q8WZ42	TTN	Titin	Myasthenia gravis	
	P08670	VIM	Vimentin	Rheumatoid arthritis	
	MDMX IP	P01023	A2M	Alpha-2-macroglobulin (Alpha-2-M)	Sjögren's syndrome
		P68133	ACTA1	Actin, alpha skeletal muscle	Autoimmune hemolytic anemia; myasthenia gravis
P07355		ANXA2	Annexin A2 (Annexin II) (Annexin-2)	Antiphospholipid syndrome	
P08758		ANXA5	Annexin 5	Antiphospholipid syndrome	
P11182		DBT	Lipoamide acyltransferase BCOADC-E2	Primary biliary cirrhosis	
Q6P0N6		DST	Dystonin	Bollous pemphigoid	
P06733		ENO1	α -Enolase	Multiple sclerosis	
P35579		MYH9	Myosin-9	Multiple sclerosis	
P08559		PDHA1	Pyruvate dehydrogenase E1-A type 1	Primary biliary cholangitis	
P21980		TGM2	Isopeptidase TGM2	Celiac's disease	
Q08188		TGM3	Transglutaminase-3	Dermatitis herpetiformis	
P29401		TKT	Transketolase	Multiple sclerosis	
P19474		TRIM21	E3 ubiquitin-protein ligase TRIM21	Sjögren's syndrome; Systemic Lupus Erythematosus	
P18206		VCL	Vinculin	Myasthenia gravis	
PICALM IP		P01023	A2M	Alpha-2-macroglobulin (Alpha-2-M)	Sjögren's syndrome
	E7EVS6	ACTB	Actin, cytoplasmic 1 (Beta-actin)	Autoimmune hemolytic anemia	
	P63261	ACTG1	Actin, cytoplasmic 2/ γ -actin	Autoimmune hemolytic anemia; myasthenia gravis	
	P63267	ACTG2	Alpha-actin-2	Autoimmune hemolytic anemia; myasthenia gravis	
	P07355	ANXA2	Annexin A2 (Annexin II) (Annexin-2)	Antiphospholipid syndrome	
	P08758	ANXA5	Annexin A5 (Anchorin CII)	Antiphospholipid syndrome	
	P17661	DES	Desmin	Sjögren's syndrome	
	P36957	DLST	2-oxoglutarate dehydrogenase E2	Pernicious anemia	
	Q08554	DSC1	Desmocollin-1	IgA pemphigus	
	Q02413	DSG1	Desmoglein-1	Pemphigus foliaceus	
	Q9Y285	FARSA	Phenylalanyl-tRNA synthetase α -subunit	Schizophrenia	
	Q02218	OGDH	2-oxoglutarate dehydrogenase E1	Pernicious anemia	
	Q5JPU3	PDHA1	Pyruvate dehydrogenase E1-A type 1	Primary biliary cholangitis	
	P21980	TGM2	Isopeptidase TGM2	Celiac's disease	
	P29401	TKT	Transketolase	Multiple sclerosis	
	P19474	TRIM21	E3 ubiquitin-protein ligase TRIM21	Sjögren's syndrome; Systemic Lupus Erythematosus	
	Q13263	TRIM28	E3 SUMO-protein ligase TRIM28	Myositis	
	Q8WZ42	TTN	Titin	Myasthenia gravis	
	P08670	VIM	Vimentin	Rheumatoid arthritis	

Table 21

Patient demographics

Clinical characteristics	Study subjects (n=44)	% of n
Maternal Age		
18-34	40	91%
≥35	4	9%
BMI		
Underweight (<18.5)	0	0%
Normal (18.5-24.9)	3	7%
Overweight (25-29.9)	9	20%
Obesity I (30-34.9)	12	27%
Obesity II (35-35.9)	5	11%
Extreme Obesity (≥40)	15	34%
Parity		
Nulliparous	11	25%
Multiparous	33	75%
Gestational Age at Delivery		
< 37 weeks	4	9%
≥ 37 weeks	40	91%
Race		
White	17	39%
African American	12	27%
Hispanic	12	27%
Other	3	7%
Diabetes		
Type 1	0	0%
Type 2	9	20%
Gestational	5	11%
Chronic Hypertension		
Normotensive	28	64%
Preeclampsia	16	36%
Preeclampsia and Diabetes	4	9%
