Abstract

AlmedReport is a proof-of-concept team-based documentation strategy that consolidates available AI research reporting guidelines and centrally tracks and organizes any information provided as part of following various guidelines. It functions to assist teams by a) outlining phases of the AI lifecycle and clinical evaluation; b) iteratively developing a comprehensive documentation deliverable and historical archive; and c) addressing translation, implementation, and accountability gaps. By acting as a hub for determining what information to capture, it helps navigate team responsibilities, simplify compliance with evaluation and reporting measures, and fulfill requirements to support clinical trial documentation and publications. Here, we give an overview of this system and describe how it can be used to address documentation and collaboration challenges in AI translation.

Introduction

The core of AI research in healthcare is carried out by AI data scientists, AI engineers, and clinicians; however, successfully evaluating and translating AI technologies into healthcare requires cross-collaboration beyond this group. Throughout ideation, development, and validation, successful translation requires engaging with many domains, including AI ethicists, quality management professionals, systems engineers, and more.¹⁻⁵ We found through a scoping review that the prioritization of proactive evaluation of AI technologies, multidisciplinary collaboration, and adherence to investigation and validation protocols, transparency and traceability requirements, and guiding standards and frameworks are expected to help address present barriers to translation.⁶ However, as identified by Lu et al⁷ through a systematic review assessing clinical prediction model adherence to reporting guidelines that no consensus exists regarding model details that are essential to report, with some reporting items being commonly requested across reporting guidelines yet other reporting items being unique to specific reporting guidelines. Unless there is clear, consistent, and unified best practices and communication and collaboration across domains, there will be gaps in development, accountability, and implementation.⁶⁻¹⁰ Documentation is a crucial part of reporting and translation, but its coordinated maintenance throughout the AI lifecycle remains a challenge.^{6,9-11}

We have established a proof-of-concept team-based documentation strategy for AI translation to simplify compliance with evaluation and research reporting standards through the development of AimedReport, a reporting guideline documentation repository.

AimedReport organizes available reporting guidelines for different phases of the AI lifecycle,

consolidating reporting items from different guidelines, assigning specific roles to team members, and guiding relevant information to capture when knowledge is generated (Appendix A).

Figure 1. Prepare phase of AlmedReport.

Method of Development

We established a centralized documentation repository by first-conducting a scoping review⁶ to investigate and understand the existing landscape of AI documentation and available resources (reporting guidelines, protocols, standards, frameworks, etc.). Within the scoping review, we found that documentation resources were fragmented throughout several reporting guidelines, prompting the consolidation and organization of such resources into AlmedReport as a tool to structure available reporting guidelines in accordance with the AI lifecycle, reduce repetitive documentation burden, and promote knowledge continuity. Six research reporting guidelines make up the AlmedReport, including: CONSORT-AI,¹² DECIDE-AI,¹³ ML Test Score,¹⁴ Model Card,¹⁵ SPIRIT-AI,¹⁶ and TRIPOD¹⁷ (Table 1). The items that make up each reporting guideline are included in the AlmedReport as “Reporting Items” and describe considerations for teams to document and maintain.

Table 1. Description of reporting guidelines included within the AlmedReport.

The AlmedReport, conceptualized in 2022, was designed in concert with the AI Evaluation Framework by Overgaard et al.¹ in 2022, which outlines clinical AI research and

development stages. This alignment was established to support compliance with reporting standards and provide a reference for the entire AI development lifecycle, aiding in informing development phases, engaging stakeholders, and supporting interpretability, knowledge continuity, transparency, and trust. While based on the Overgaard et al.¹ framework, AlmedReport's matured versatility allows it to potentially suit other frameworks such as van der Vegt's¹⁸ SALIENT framework for broader AI implementation.

Each Reporting Item was mapped to one of the phases of the AI Evaluation Framework¹ to streamline documentation when knowledge is generated: Prepare, Develop, Validate, Deploy, and Maintain. The "Prepare" phase focuses on metadata related to the owner, defining the model's purpose and clinical impact, data preparation, and planning for model development. The "Develop" phase centers around model development and evaluation, usability related to inputs, assessing risk and bias, and protocol development for validation studies. The "Validate" phase catalogs information about the design and execution of how the model was validated, summative usability testing, generating user education, and planning for deployment. The "Deploy" phase focuses on clinical validation and generating training materials. Lastly, the "Maintain" phase plans for post-deployment surveillance and maintenance and quality monitoring and auditing. Reporting items were grouped into each of these five phases and then further classified into subgroups by identifying common themes (i.e., Prepare- Purpose and Clinical Impact; Develop- Model Development and Evaluation; Deploy- Clinical Validation). For each "Reporting Item", the team or team members that need to be involved at each phase and in what ways (e.g., reporting, maintaining documentation, or utilization) were also defined, as shown in Table 2.

Table 2. AI lifecycle phases into which AlmedReport “Reporting Items” were sorted, along with subphases and interdisciplinary alignment that came from further organization.

Discussion

The interactions among AI technologies, their users, and the implementation environments actively define the overall potential effectiveness of AI interventions within healthcare, especially because these tools are complex interventions designed as clinical decision support systems, not autonomous agents.^{8,19,20} A tailored, step-by-step approach may support the transition of AI technologies from being evaluated by statistical performance to clinical validity. To address this translational gap, AlmedReport was developed to assist teams in several key areas, including a) outlining phases of the AI lifecycle and clinical evaluation, b) developing a comprehensive documentation deliverable and historical archive, and c) addressing translation, implementation, and accountability gaps. This is achieved by consolidating the existing landscape of research reporting guidelines into a repository. This repository acts as a centralized documentation hub and provides a standardized list of considerations and accountability assignments as the solution advances across the development lifecycle. AlmedReport, accessible [here](#), (Appendix A), is presently a prototype tool housed in a spreadsheet, but is planned to be made available as a Web resource and a software platform. This will likely further enhance the tool’s usability, reproducibility, and convenience by providing the ability to automate the documentation process, enhance task completion and generate deliverables in accordance with relevant reporting measures, and

allow for communication and updates to model documents to be centrally available across teams.

Introducing such a platform allows for transparent communication of evaluation and reporting measures, but also embraces anticipated changes and modifications that come with development and maintenance. Each “Reporting Item” can be assigned to a team or team member to define who is responsible, accountable, consulted, and informed, who can then use the Reporting Item description as a reference to satisfy their role.²¹ For example, project managers, user experience researchers, and machine learning operations (MLOps) can contribute model overview, goals, and future state from their respective perspectives and reference one another’s vision. Similarly, data scientists, AI ethicists, informatics teams, and clinical practice committees may use documented demographic data of patient populations to assess items such as bias, differential model performance, appropriate clinical location, and potential clinical workflow location. During deployment and maintenance, the primary user and updater of the documentation will be an MLOps team, to ensure requirements set by previous groups are met, monitoring input and output metrics for drift, volume, and appropriate use. This can also facilitate interoperability between organizations, as the tool provides a standardized format, and documentation can be transferred across organizations and research governing bodies for consumption, auditing, and monitoring. AlmedReport also serves as a source of information describing completed evaluation and research reporting measures and can therefore fulfill reporting requirements to support clinical trial documentation and other publications. Additional descriptions of roles and responsibilities included within AlmedReport can be found in Appendix B.

This paper focused on describing the theorization and development of AlmedReport as a proof of concept to aid in evaluating, consolidating, and understanding available documentation resources to support AI reporting and facilitate communication across a multidisciplinary team. AlmedReport primarily concentrated on research reporting guidelines to address the immediate gaps identified within documentation practices. We note recent progress as the field rapidly advances towards enhancing implementation strategies within multidisciplinary teams. For example, in a study conducted by van der Vegt et al.¹⁸ titled "Implementation Frameworks for End-to-End Clinical AI: Derivation of the SALIENT Framework," an extensive mapping exercise was conducted to synchronize various guidelines with an AI implementation framework. We suggest that AlmedReport could further contribute to such implementation endeavors as a valuable resource. Planned future work will continue to converge with and align to various frameworks, like the SALIENT framework,¹⁸ ABCDS,²² and organizations, including the Office of the National Coordinator,²³ Food & Drug Administration,²⁴ Coalition for Health AI,²⁵ National Academy of Medicine,⁵ Health AI Partnership,²⁶ National Institute of Standards and Technology,²⁷ World Health Organization,²⁸ and others.

We believe that AlmedReport can be used in its current formative state for researchers and healthcare organizations to adhere to evaluation and research reporting standards, as well as to bridge some of the reporting and documentation requirements for products necessitating design controls under good manufacturing practices of the quality system regulation, such as those that may be Software as a Medical Device (SaMD).²⁸⁻³⁰ Future iterations of AlmedReport will better align translational science and regulatory science so that documentation can be used directly by teams pursuing regulated pathways, aligning with the information needed by

regulatory review groups, accreditation commissions, and regulatory bodies (e.g., Food & Drug Administration).

Next Steps and Conclusion

Our multidisciplinary team developed AlmedReport as a strategic effort to address collaboration and documentation challenges in AI translation. AlmedReport functions to assist teams by a) outlining phases of the AI lifecycle and clinical evaluation, b) iteratively developing a comprehensive documentation deliverable and historical archive, and c) addressing translation, implementation, and accountability gaps. By consolidating the existing landscape of research reporting guidelines into a repository, AlmedReport acts as a centralized documentation hub that provides a standardized list of considerations and accountability assignments to guide information capture when knowledge is generated and simplify compliance with evaluation and reporting measures as AI technologies advances across the lifecycle. Completed measures documented within the AlmedReport may also serve as a source of information to fulfill reporting requirements to support clinical trial documentation and other publications. The integration of AlmedReport into existing IT infrastructure and reporting platforms has undergone phased development, starting with the creation of a Model Documentation Framework presented at the AMIA 2022 Clinical Informatics Conference, refined through feedback from the Coalition for Health AI in 2022,³¹ and forming the foundation for collaborative efforts across various AI evaluation considerations. Mayo Clinic's regulatory and systems engineering teams are adapting the AlMedReport framework to fit within regulatory infrastructure, aiming to scale multidisciplinary reporting for enterprise-wide AI applications.

This integration process involves continued interdisciplinary collaboration and evaluation to ensure scalability and applicability across Mayo Clinic departments and disciplines.

Future work will include expanding AlmedReport beyond a proof-of-concept phase and supporting various frameworks and organizations to enhance usability, including direct alignment of translational and regulatory sciences through FDA SaMD documentation.

Reporting Guideline	Description
Consolidated Standards of Reporting Trials – Artificial Intelligence (CONSORT-AI)	Aims to promote transparency and completeness in reporting clinical trials for AI interventions, helping to understand, interpret and appraise the quality of clinical trial design and risk of bias in the reported outcomes; focuses on reporting the results of clinical trials
Developmental and Exploratory Clinical Investigation of DEcision-support systems driven by Artificial Intelligence (DECIDE-AI)	Aims to improve the reporting of studies describing the evaluation of AI-based decision support systems during their early, small-scale implementation in live clinical settings
ML Test Score	Aims to measure production readiness of a machine learning system is by offering a scoring system that focuses on assessing testing and monitoring needs
Model Card	Aims to encourage transparent model reporting, clarifying the intended use cases of models and detailing performance characteristics
Standard Protocol Items: Recommendations for Interventional Trials (SPIRIT-AI)	Aims to promote transparent prospective evaluation and completeness of clinical trial protocol reporting for AI interventions; focuses on publishing the clinical trial protocol before the trial is conducted
Transparent Reporting of a multivariable prediction model for Individual Prognosis or Diagnosis (TRIPOD)	Aims to improve the transparency and reporting of studies developing, validating, or improving a prediction model

Appendix

Appendix A: AlmedReport

AlmedReport is comprised of reporting items, outlined following product lifecycle phases to guide translation and promote transparent and explainable AI/ML-based MMS documentation.

Access to the live document can be found here: [AlmedReport Link](#)

Appendix B: Example AI Research Team Roles and Responsibilities

Role	Example Accountability
Project Manager	Manage the development and execution of a project, tracking progress and team communication to achieve project objectives.
Clinical Expert	Provides knowledge of clinical context throughout the AI lifecycle to inform design, usability, and adoption.
UX Researcher	Gathers user feedback and understands mental models of end users. Identifies users' needs and behaviors through direct observations, interviews, surveys, and usability evaluations to inform product design and development.
Ethicist	Identify types of possible harms, and specific potential subjects of harms; reason about underlying unjust historical and social processes that might eventually lead to differential model performance via measurement error, choice of sample, what data for which subjects are available or not.
Data Engineer	Manage data collection, connections, quality, cleaning, storage, processing and create data pipelines.
Data Scientist	Conduct data cleaning and quality checks, as well as employ appropriate statistical and machine learning approaches to uncover underlying meaningful relationships and patterns within datasets to allow for downstream actionable outcomes
MLOps	Actualize machine learning models into practice implementation and deployment through constructing necessary data connections and pipelines into production environments with appropriate model auditing, maintenance, monitoring, and feedback mechanisms in place.
System Engineer	Plan, define, test, and evaluate products for safety and efficacy against established best practices and procedures and external guidance or standards
Software Engineer	Build out data pipelines towards front-end users, accounting for resilient, scaled, and accurate cloud services through collaboration with data engineers and project developers to capture requirements and algorithms within application end products
Translational Informaticists	Bridges AI-model development and clinical implementation by aligning scientific and operational principles across teams
Regulatory and Legal	Manage and strategize compliance with regulatory policies and procedures, including those related to device classification and risk assessments.
Quality Management	Define and establish internal processes to fulfill quality mandates driven by institutions or external governance bodies.
