PUBLIC ATTITUDES TOWARDS FOOD TAXES FOR HEALTHY EATING IN THE UNITED KINGDOM

*Mario Martínez-Jiménez[1, *], Hannah Brinsden[2], Franco Sassi[1]*

Abstract

Introduction: Appropriately designed food taxes can improve diet quality and health. Fiscal levers are used in several countries to combat the rise in obesity and diet-related diseases. This study aims to investigate public attitudes, knowledge, and policy preferences regarding food taxes for promoting healthy eating in the UK.

Methods: A survey was administered through YouGov Plc to a nationally representative sample of 2,125 adults, gathering information on: acceptability and support for different types of food taxes, awareness and knowledge of existing taxes, and preferences for the characteristics of possible new taxes.

Results: Overall, 48% of respondents support higher taxes on unhealthy foods, rising to 72% if taxes made healthy foods more affordable. Respondents with high socio-economic status and those living in London showed the highest support. Respondents had limited awareness of existing food and beverage taxes, and prioritised discretionary items such as cakes and crisps for possible increased taxation.

Conclusions: The survey shows a high level of support for taxing unhealthy foods, as well as concern for the affordability of healthy foods. A carefully designed holistic approach to food taxation can be part of a wider public health strategy and can be favourably met by the general population in the UK.

Keywords: Fiscal policies; Public attitudes; Food policy; Taxes; Obesity

1. INTRODUCTION

The use of fiscal incentives to promote healthy eating has increased in the past decade, amid a continuing growth in obesity and diet-related diseases. While many countries currently apply taxes on sugar-sweetened beverages (Hattersley et al., 2023), a smaller number of countries have utilised taxes to promote healthy eating, and most of the latter are limited in scope (WHO, 2022). This paper aims to provide insights on public attitudes for policymakers seeking to use fiscal levers to address the challenge of unhealthy dietary choices.

Food taxation has the potential to improve health by reducing the consumption of unhealthy foods and improving diet quality (Gorski et al., 2015). The ultimate goal of health taxes applied on food is to curb diet-related conditions such as obesity, diabetes and tooth decay (Griffith et al., 2021; Colombo et al., 2023; Hashem et al., 2024).

Public support for taxes is an important factor for successfully getting a tax implemented (Thow et al., 2022), even more so in the context of the rising cost of living where many people are concerned about food prices (Broadbent et al., 2023). Understanding public attitudes towards food taxes is essential for the successful implementation and sustainability of such health policies. This study aims to provide valuable information for policymakers, enabling them to design and advocate for food taxation measures that are not only effective in promoting healthier eating habits but also supported and acknowledged by the public. This, in turn, can lead to improved public health outcomes and a reduction in diet-related diseases in the UK.

Our study explores public attitudes towards the implementation of food taxes aimed at promoting healthy eating by conducting a nationally representative survey of 2,125 adults in the UK between April 12th and 14th, 2024. Our survey covers three main areas: (i) support, in principle, for a new tax on unhealthy food; (ii) awareness of the current taxes on foods and non-alcoholic beverages in the UK, the Value-Added Tax (VAT) and the Soft Drink Industry Levy (SDIL), and (iii) public preferences regarding specific characteristics of a possible new tax on unhealthy foods. Our headline results show that there is support for food taxes on unhealthy food, particularly when coupled with measures to make healthier food more affordable. Findings also show poor awareness of existing taxes, which is poorer for the SDIL than for VAT. Support is higher among females, people of high social class, and people living in London. Priority targets for possible taxes on unhealthy foods included food groups such as cakes, potato crisps, hot takeaways and ready meals.

Literature review

Food taxation has been extensively studied as a potential public health measure aimed at incentivising healthier dietary choices. Research indicates that prices and promotions within the food environment can significantly influence consumer behaviour, often encouraging the selection of foods contributing to less healthy diets. Taxation of unhealthy products, such as tobacco, alcohol or sugar, is not new, but traditionally these taxes have been used for purely fiscal reasons, i.e., to generate tax revenues in order to finance public spending.

Empirical evidence from various countries demonstrates that taxation can be an effective tool for promoting healthier dietary choices (Andreyeva et al., 2022; Pineda et al., 2024). Scarborough et al. (2020) show that in 2016, as a result of the SDIL — a tax on soft drinks that contain more than 5 g of sugar per 100 mL – the percentage of drinks with sugar fell from 49% to 15% between September 2015 and February 2019 in the United Kingdom. Taillie et al. (2017) show a 12% reduction in sales in the first year following the implementation of Mexico's 8% nonessential energy-dense food tax, driven by lower-income households. Similarly, Berkeley's sugar-sweetened beverages (SSB) tax resulted in a 21% drop in the consumption of sugary drinks, demonstrating the potential of such taxes to alter consumer behaviour. In 2011, Denmark implemented a €2.14 per kg tax on saturated fat for products with more than 2.3 g per 100 g of saturated fat. Although this tax was subsequently repealed in 2013, for the duration of implementation, saturated fat purchases were reduced by 4%, and deaths attributable to non-communicable diseases were estimated to have been reduced by 0.4% (Smed et al., 2016). Hungary has introduced a tax targeting prepacked foods that are high in salt, sugar, or caffeine (at varying tax rates), which has been associated with a 3.4% reduction in the consumption of processed food (and a compensatory 1.1% increase in unprocessed food) as shown by Bíró et al. (2015).

Public attitudes towards taxes, particularly those aimed at improving health, vary widely depending on the context. In the case of health taxes, such as those on tobacco (Filippidis et al., 2014; Farley et al., 2015) and sugary drinks (Jou et al., 2014; Miller et al., 2019; Pell et al., 2019; Chriqui et al., 2020), there tends to be a higher level of support when the public perceives a clear link between the tax and health benefits. In contrast, general taxes are often viewed through a lens of economic impact and fairness (Sumino, 2016; Lachapelle, 2021). Public trust in government plays a significant role in shaping these attitudes; higher trust correlates with greater acceptance of both specific and general taxes. Eykelenboom et al. (2019) conducted a systematic review synthesising the existing

literature on the political and public acceptability of an SSB tax covering countries around the world (e.g., the US, Australia, the UK, Mexico, China, France, New Zealand, among others). The authors found that of the public, 42% supported a tax on SSB, 39% supported an SSB tax as a means of tackling obesity, and 66% supported such a tax where the revenue was used "appropriately," e.g. for health initiatives.

Regarding the acceptability of food taxes, Mazzocchi et al. (2015) found that the main drivers of policy support in five European countries are attitudinal factors, particularly the belief that obesity is largely due to the excessive availability of unhealthy foods. Socio-demographic characteristics and political preferences, however, are not strongly correlated with support for these policies. In Germany, Jurkenbeck et al. (2020) found that a large majority of citizens accept nutrition policy interventions, mostly among those individuals who generally maintain a healthy diet and those who struggle with dietary habits. In Norway, Grimsrud et al. (2019) demonstrated that there is significant public acceptance and willingness to pay for cost-effective taxes, particularly on red meat, despite the public's scepticism towards the introduction or increase of taxes aimed at environmental improvement. This suggests that while environmental taxes may face resistance, targeted nutritional interventions addressing public health concerns can receive substantial support across diverse demographic groups.

2. MATERIALS AND METHODS

2.1. Survey data collection and sample

We collected our survey data between April 12th and 14th, 2024 through YouGov Plc (https://yougov.co.uk/). The survey was conducted using online interviews with members of the YouGov panel, which consists of 185,000+ individuals who have agreed to participate in the Company's surveys. To ensure the sample is representative of the UK population or specific sub-groups, stratified sampling techniques are used to select respondents based on key demographics such as age, gender, region, and socio-economic status. Surveys are distributed to the selected sample via email invitations or through the YouGov platform, allowing respondents to respond at their convenience. YouGov Plc typically achieves a response rate of between 35% and 50% for surveys, although this can vary depending on the subject matter, complexity, and length of the questionnaire.

Table 1. Sample representativeness and summary statistics of survey participants

		Weighted Sample		Unweighted Sample		Population
		N	%	N	%	%
Gender	Male	1031	48.5	966	45.5	49.45
	Female	1094	51.5	1159	54.5	50.55
Age	18-24	223	10.5	192	9	8.3
	25-49	878	41.3	894	42.1	32.9
	50-64	527	24.8	534	25.1	19.5
	65+	497	23.4	505	23.8	18.4
Social Grade	ABC1	1211	57	1258	59.2	57
	C2DE	914	43	867	40.8	43
Country	England	1785	84	1790	84.2	84
	Wales	104	4.9	113	5.3	4.7
	Scotland	181	8.5	172	8.1	8.2
	Northern Ireland	55	2.6	50	2.4	2.9
Region in England	North	499	27.9	507	28.3	27
	Midlands	342	19.2	354	19.8	20
	London	251	14.1	217	12.1	16
	South	693	38.9	712	39.8	32
	Total	**2,125**	100	**2,125**	100	100

Notes: Total sample size are 2,125 adults. Fieldwork was undertaken between 12th - 14th April 2024. The survey was carried out online. The figures have been weighted and are representative of all UK adults (aged 18+). *Source:* YouGov and Office National Statistics (ONS).

The responding sample is weighted to match the profile of the original target sample. During the survey period, response rates and data quality are monitored, and if certain demographics are underrepresented, additional invitations may be sent to those groups. The survey was completed by 2,125 adults between April 12th and 14th, 2024, using an online questionnaire. Table 1 shows that the resulting (weighted) sample is representative of the UK population. One dimension in which our sample may differ is regarding political preferences (captured by the 2019 General elections and EU referendum in 2016), in which missing observations account for around 26 and 23 per cent of our sample (see Appendix A). For that reason, political party preference is not used in our main analysis. All analyses reported in this paper are based on the weighted sample.

2.2. The questionnaire and demographic characteristics

The questionnaire is structured in three parts, described as *(i)* acceptability/support, *(ii)* awareness/knowledge and *(iii)* preferences on characteristics of a possible food tax. Our questionnaire includes eight closed-ended questions. Three questions were asked about awareness/knowledge of the UK tax system for food and drinks (VAT and SDIL), and two questions addressed the acceptability of taxes on unhealthy food. Finally, a set of questions captures individuals' preference for a possible new tax on unhealthy foods. This refers to one question

focused on which food groups should or should not have a higher tax, while two more questions asked about specific goals, such as discouraging people from purchasing certain products and encouraging them to buy others instead.

Based on previous public opinion research on perception and attitudes towards taxes and policies, we asked respondents about their basic socioeconomic and demographic characteristics, including their age (<30; 30-44; 45-64; >64), social class ("Grade A: Professionals; very senior managers business; top-level civil servants", "Grade B: Middle-management executives/Principal officers/Top management or owners of small business" or "Grade C1: Junior management/varied responsibilities and educational requirement", and zero if "Grade C2: Skilled manual workers/Manual workers with responsibility for other people", "Grade D: Semi-skilled and unskilled manual workers, apprentices and trainees of skilled workers" or "Grade E: Long-term recipients of state benefits/Unemployed/Off sick/casual workers". We also controlled for region and country (London, Scotland, Wales, North Ireland and England). Appendix C provides the full questionnaire as well as links to each country's questionnaire in the original language.

Our study measures respondents' support for food taxes that promote healthy eating through two main questions: "Would you support or oppose a higher tax on unhealthy foods?" and "Would you support a higher tax on unhealthy foods if money makes healthy food cheaper?"

2.3. Statistical approach

To investigate the relationship between respondent characteristics and support for food taxes towards healthy eating habits, we estimate a linear probability model (LPM). A set of outcome variables captures to what extent a tax on unhealthy foods is supported by respondents. These variables are binary regarding the extent of support for taxes on unhealthy food, taking values one if the respondent "strongly/somewhat supports" and zero if the respondent "strongly/somewhat opposes." Sociodemographic characteristics included in the analysis are age groups, a binary variable capturing manual/non-manual social class (which takes one if the respondent's social class grade is A/B/C1 and zero if C2/D/E. We also controlled by regions/countries. We provide estimates with robust standard errors, and survey weights are used in all the regressions. Robustness checks are performed, including using an alternative statistical model (logistic regression), controlling for political preferences, and testing for multicollinearity bias when selecting our control variables. Results for all the robustness checks are available in Appendix B.

3. RESULTS

3.1. Knowledge of existing taxes applied to food and non-alcoholic drink products

We first analyse the level of awareness of existing taxes applied to foods and non-alcoholic beverages, VAT and SDIL. We found greater awareness of VAT compared to SDIL, with just 3.2% considered to have 'no knowledge' of VAT, compared to 23.2% for SDIL. There was, however, a similar number of people who we classify as 'very knowledgeable' across both of the taxes (28.6% for VAT and 26.4% for SDIL) – see Figure A1 in Appendix A.

We then asked whether a selection of foods have or do not have SDIL and VAT applied to them. While 68.4% correctly identified that soft drinks have VAT, only 28.8% identified that bottled water had VAT applied. There is also high awareness amongst respondents that foods from both takeaways (69.5%) and restaurants (79.5%) have VAT applied. More than half of respondents (57.5%) incorrectly thought that cakes had VAT applied, with only 19.5% correctly identifying that they did not. The responses on the two meat options (fresh and processed) were mixed, with more people thinking VAT is applied to processed meat compared to fresh meat, 42% correctly identifying that fresh meat does not have VAT, and only 25.7% correctly identifying that processed meat does not. Between 13% and 30% of respondents reported they do not know whether taxes apply for each of the mentioned food groups, with the highest rate for bottled water and the lowest rate for restaurant meals – see Figure A2 in Appendix A.

3.2. Support and opposition for higher food taxes for healthier eating habits

Overall, 48% of respondents supported higher food taxes (compared to 44% who opposed them), and this number would increase to 72% if the money raised were used to make healthier food more affordable.

Regarding respondents' level of support of food taxes on unhealthy food by sociodemographic characteristics, we find no substantial variation in support by age group, 18-24 (49 vs 42%). 25-49 (46 vs 45), 50-64 (50 vs 45). 65+ (50 vs 44), as we can see in Figure A3 in Appendix A. However, some differences are found by socioeconomic status. In Figure 1, we can see that people in non-manual professions are more likely to support higher taxes on unhealthy food, with percentage ranges of support between 63.7% and 52.3%. In contrast, those individuals who are long-term recipients of state benefits, unemployed or casual workers show the lowest support for these taxes with 42% of respondents.

Figure 1. Share of respondents who agree (somewhat too strongly) that "Would you support a higher tax on unhealthy foods?" or "Would you support a higher tax on unhealthy foods to make healthy food cheaper" by socioeconomic status

Notes: Socioeconomic status groups include the following professions: Professionals (grade A: Professionals; very senior managers in business; top-level civil servants); Middle-management (Grade B: Middle-management executives/Principal officers/Top management or owners of small businesses); Junior-management (Grade C1:Junior management/varied responsibilities and educational requirements); Skilled manual workers (Grade C2:Skilled manual workers/Manual workers with responsibility for other people); Unskilled manual workers (Grade D: Semi-skilled and unskilled manual workers, apprentices and trainees of skilled workers); and Unemployed/State benefits (Grade E: Long-term recipients of state benefits/Unemployed/Off sick/casual workers).

By region and country, we find the highest support in London, with 62.2% of respondents supporting a tax on unhealthy food, increasing to 83.7% if the tax was used to make healthier food more affordable. Respondents living in Northern Ireland had the lowest support for the tax at 44.9%; it had the biggest increase in support when asked about also making healthier food more affordable, with an increase of 31.7 percentage points to 76.6%. The lowest support in England was among those living in the North East, with 49.5% reporting to support a tax - see Figure A4 in Appendix A.

Figure 2 shows the results of the linear probability model of supporting taxes on unhealthy foods conditional to certain socioeconomic characteristics. In particular, we control the support on food taxes on age groups (reference group is those between 18-30 years old), gender, non-manual social class and living in London. Here, we can see that those in non-manual professions and living in London are statistically significantly more likely to support taxes on unhealthy foods compared to

their counterparts. Similarly, women and those in non-manual professions are more likely to support a tax on unhealthy food that makes healthy food cheaper.

Figure 2. Correlation between support for a tax on unhealthy foods and socioeconomic characteristics

Notes: Base categories: age between 18-30; male; manual professions (social class grade: C2/D/E); other countries and English regions of the UK. The number of observations is 1,971, as those answering 'do not know' are not included.

3.3. Insights on preferences for policy design and purpose

Table 2 shows levels of support for a possible tax on unhealthy foods for the full sample and specifically for those who had reported supporting or opposing taxes on unhealthy foods. Overall, we can see a similar pattern of support when comparing the full sample to just those who supported a tax, with higher support and lower opposition seen for specific categories amongst those who supported a tax. A much bigger difference between support and opposition was also seen within the smaller sample of supporters.

Table 2. Support for food taxes by food categories and level of support for a tax on unhealthy foods

Food category	Full sample (N= 2,125)			Support a tax (N= 1,047)			Oppose a tax (N= 924)		
	Support	*Oppose*	*Do not Know*	*Support*	*Oppose*	*Do not Know*	*Support*	*Oppose*	*Do not know*
Milkshakes	33.04	52.09	14.87	51.77	35.72	12.51	14.72	73.59	11.69
Fruit juice	11.76	76.14	12.09	19.01	70.11	10.89	4.55	87.23	8.23
Fresh fruit and vegetables	1.27	92.38	6.35	1.72	93.98	4.30	0.87	94.81	4.33
Potato crisps	41.84	46.02	12.14	65.81	24.83	9.36	18.18	72.51	9.31
Read and processed meat	23.29	64.94	11.76	37.63	51.86	10.51	8.23	84.09	7.68
Cakes	45.32	42.12	12.56	69.25	20.92	9.84	21.65	68.40	9.96
Ready meals	37.18	49.93	12.89	57.40	32.00	10.60	17.42	73.05	9.52
Hot takeaways and deliveries	40.52	46.87	12.61	60.74	28.94	10.32	20.56	69.81	9.63

Notes: These results come from the following question: "Do you think the following foods should or should not have a higher tax applied to them?"

The only category which had more support than opposition amongst the full sample was cake, with 45.32% reporting to support a potential tax on this category (versus 42.12% who opposed it). This figure increased to 69.25% support (and 20.92% opposed) when only looking at those who were generally supportive of a tax. The second most supported category was crisps (41.84% support vs 46.02% opposed), however again support increased to 65.81% (vs 24.83%) when looking only at those who supported a tax. Other categories with support include hot takeaways (40.52%) and ready meals (37.18%). Support was low for a tax on red and processed meat (23.29%) and, unsurprisingly, fruit and vegetables (1.27%). Overall, we can see more support for a tax on discretionary products which fall outside of the Government recommended Eatwell Plate (e.g. cakes and biscuits) rather than meals (ready meals and takeaways) and less processed foods (e.g. fruits, vegetables and meat).

Figure 3. Share of respondents on each of the goals that could be tackled by taxing food and drink products

Source: YouGov survey March 2024

Notes: Question 8: "Some taxes are applied to products to specifically achieve certain goals, either through the revenue raised or by discouraging people from purchasing those products and encouraging them to purchase others instead. Thinking about different goals that could be tackled by taxing food and drink products, which of the following do you think is most important?"

To better understand what criteria/outcomes that respondents most value to justify a tax on foods, respondents were asked about their priority goal that a tax should address. The highest support of the options provided was for making healthier food more affordable (34.8%), followed by obesity (14.9%), improving children's diet/health (12.4%) and improving adult's diet and health (12.0%). Fewer people put fair trade and environmental outcomes as their priority. The high support for a tax which can make healthier food more affordable is consistent with the findings that there is greater support for a tax if it is also used to make healthier food more affordable. It is also reflective of the current cost-of-living crisis, which has led to 1 in 5 households reporting to be affected by food insecurity in January 2024 (Food Foundation, 2024) and food prices increasing by roughly 25% (Food Foundation, 2024).

4. DISCUSSION

Our representative national survey of 2,250 people in the United Kingdom provides valuable insights into public attitudes towards food taxes aimed at promoting healthier eating. The findings

highlight several key aspects that policymakers need to consider when designing and implementing such taxes.

While the survey shows a considerable degree of support for the idea of taxing unhealthy foods, the extent of this support varies across different groups of respondents. Support for the idea of a tax is also significantly higher when it is coupled with efforts to make healthier food more affordable or cheaper. The survey also reveals that a substantial share of respondents had poor knowledge about taxes currently applied on food and non-alcoholic beverages in the UK. This lack of awareness and knowledge about the health impacts of unhealthy foods and the potential benefits of food taxes may play an important role in shaping public attitudes towards taxes. Respondents expressed varying preferences regarding the specific foods to be taxed, goals and the allocation of tax revenues. Importantly, there is a preference for taxing discretionary items such as cakes and crisps rather than meals and for revenues to help make healthier food more affordable. In addition, the most supported goal of a food tax is to make healthier foods more affordable. Understanding these preferences can help policymakers design food taxes that are more likely to gain public support and achieve desired health outcomes.

In conclusion, the survey provides evidence that carefully designed food taxes aimed at incentivising healthy eating and curbing diet-related diseases can find support from a sizable majority of the UK population, provided that attention is paid to the affordability of healthy foods in designing the tax incentives.

APPENDIX A. Further Tables and Figures

Table A1. Descriptive statistics for sample party policy preferences

Vote in 2019 General Elections	*Con*	678	31.9	690	32.5	43.6
	Lab	497	23.4	494	23.2	32.1
	Lib Dem	178	8.4	179	8.4	11.5
	Do not know/skipped			553	26	
EU Referendum 2016	*Remain*	746	35.1	861	40.5	48.11
	Leave	788	37.1	775	36.5	51.89
	Did not vote/can't remember			489	23	

Notes: Total sample size are 2,125 adults. Fieldwork was undertaken between 12th - 14th April 2024. The survey was carried out online. The figures have been weighted and are representative of all UK adults (aged 18+). *Source:* YouGov and Office National Statistics (ONS).

Figure A1. Self-reported knowledge of taxes on food and beverages in the United Kingdom: share of respondents

Notes: Self-reported knowledge of taxes on food and beverages are defined as follows: poor knowledge: "I have never heard of it and don't know anything about what foods it is added to"; Little knowledgeable: "I have heard of it, but don't know anything about what foods it is added to"; Knowledgeable: "I know what it is, but know little about what foods it is added to"; and Very knowledgeable: "I know what it is, and the foods it is added to".

Figure A2. Knowledge about food groups which have VAT applied: Share of correct answers in dark blue

Notes: Dark blue bar represents the correct option.

Figure A3. Share of respondents support a higher tax on unhealthy foods by age groups

Figure A4. Share of respondents who agree (somewhat to strongly) that "would you support a higher tax on unhealthy foods?" or "Would you support a higher tax on unhealthy foods to make healthy food cheaper" by regions

Figure A5. Support for tax on unhealthy foods between different food categories

Source: YouGov survey March 2024

Figure A6. Support for tax on unhealthy foods within foods in the same category

APPENDIX B. Empirical Methodology and Robustness Checks

To investigate the relationship between individuals' sociodemographic characteristics and support for unhealthy food taxes, we estimate the following regression:

$$y_{ir} = \alpha + \gamma X_{ir} + \emptyset_r + \mu_i \tag{1}$$

Where y_i is a set of outcome variables capturing to what extent support a tax on unhealthy foods by person i. These variables are binary regarding the extent of support for taxes on unhealthy food, taking values one if the respondent *"strongly/somewhat supports"* and zero if the respondent *"strongly/somewhat opposes."* Sociodemographic characteristics included in the analysis are age groups, a binary variable capturing high social class (takes one if the respondent's social class is *ABC1*, and zero if *C2DE.* We also include political options in the last 2019 election and region/country fixed effects. We estimate both a linear probability model (LPM) and a logit fixed-effect model (Logit-FE). We provide estimates with robust standard errors and survey weights are used in all the regressions.

The following robustness checks have performed, including (i) hypothesis test on the statistical differences among the control variables for our two main outcomes; (ii) multicollinearity test, Variance inflation factor (VIF), and correlation plots; and (iii) logistic regressions as a main econometric specification.

1. **Test for supporting tax on subsidy:**

```
. test age_cat_2 age_cat_3 age_cat_4 gender highsocial_class London England

 ( 1)  age_cat_2 = 0
 ( 2)  age_cat_3 = 0
 ( 3)  age_cat_4 = 0
 ( 4)  gender = 0
 ( 5)  highsocial_class = 0
 ( 6)  London = 0
 ( 7)  England = 0

      F(  7,  1987) =    7.64
           Prob > F =    0.0000
```

2. Test for supporting taxon unhealthy foods

```
. test age_cat_2 age_cat_3 age_cat_4 gender highsocial_class London England

 ( 1)  age_cat_2 = 0
 ( 2)  age_cat_3 = 0
 ( 3)  age_cat_4 = 0
 ( 4)  gender = 0
 ( 5)  highsocial_class = 0
 ( 6)  London = 0
 ( 7)  England = 0

       F(  7,  1963) =    4.37
            Prob > F =    0.0001
```

Table B1. Multicollinearity test (VIF) amind socioeconomic variables

Variable	VIF	1/VIF
Age<30	1.30	0.77
Age 30-44	1.50	0.66
Age 45-64	1.36	0.73
Female	1.02	0.98
High Social Class	1.06	0.94
Brexit Party	2.50	0.40
Conservative	19.01	0.05
Green	3.01	0.33
Labour	16.85	0.05
Other	8.61	0.11
Plaid Cymru	1.38	0.72
SNP	4.31	0.23
London	1.06	0.94
Scotland	1.71	0.58
Wales	1.12	0.89
Northern Ireland	2.88	0.34

To interpret the results:

- A value of 1 indicates there is no correlation between a given explanatory variable and any other explanatory variables in the model.

- A value between 1 and 5 indicates moderate correlation between a given explanatory variable and other explanatory variables in the model, but this is often not severe enough to require attention.

- A value greater than 5 indicates potentially severe correlation between a given explanatory variable and other explanatory variables in the model. In this case, the coefficient estimates and p-values in the regression output are likely unreliable.

Figure B1. Logistic regression results for our main two outcomes on tax support on unhealthy foods

Notes: Base categories: age>30. N= 1,971

Appendix C. The Questionnaire and variable definition

{single}

Q1) Generally speaking, would you support or oppose a higher tax on unhealthy foods?
<1> Strongly support
<2> Somewhat support
<3> Somewhat oppose
<4> Strongly oppose
<5>Don't know

{single}
Q2) And would you support or oppose a higher tax on unhealthy foods if the money raised was used directly to help make healthier food cheaper?
<1> Strongly support
<2> Somewhat support
<3> Somewhat oppose
<4> Strongly oppose
<5>Don't know

[grid]
Q3) How much, if at all, do you know about the following taxes and which foods they are added to?
- **Value Added Tax (VAT)**
- **Soft Drink Industry Levy (SDIL)**

<1> I know what it is, and the foods it is added to
<2> I know what it is, but know little about what foods it is added to
<3> I have heard of it, but don't know anything about what foods it is added to
<4> I have never heard of it and don't know anything about what foods it is added to

[grid]

Q4) Which of the following foods do you think have and don't have VAT added to them?

A. Soft drinks
B. Bottled water
C. Fresh meat
D. Processed meat (e.g. ham)
E. Cakes
F. Chocolate and confectionery
G. Food eaten in restaurants and cafes
H. Hot takeaways and deliveries

<1> Does have VAT
<2> Does not have VAT
<3> Don't know

Q4) Which of the following drinks do you think have and don't have Soft Drinks Industry Levy (SDIL) added to them?

    A. Soft drinks
    B. Bottled water
    C. Fruit juice
    D. Milkshakes

<1> Does have SDIL
<2> Does not have SDIL
<3> Don't know

[grid]

5) Do you think the following foods should or should not have a higher tax applied to them?

    A. Milkshakes
    B. Fruit juice
    C. Fresh fruit and vegetables
    D. Potato crisps
    E. Red and processed meat
    F. Cakes
    G. Ready meals
    H. Hot takeaways and deliveries

<1> Should have a higher tax
<2> Should not have a higher tax
<3> Don't know

{Single}
Q6) Some taxes are applied to products to specifically achieve certain goals either through the revenue raised or by discouraging people to purchase those products and encouraging them to purchase others instead.
Thinking about different goals that could be tackled by taxing food and drink products, which of the following do you think are most important?
<1> Protecting the environment
<2> Improving adults' diet and health
<3> Supporting fair trade products
<4> Making healthy food more affordable
<6> Improving children's diet and health
<7> Reducing obesity levels
<8> Other
<9> None of these
<10> Don't know

{grid}
Q7) Would you support or oppose the following…

- Making it less expensive for people to choose healthy foods (e.g. fruit and vegetables), and more expensive to choose less healthy foods (e.g. deserts, prepared meals)
- Making it less expensive for people to choose healthier options within food groups (e.g. ready meals containing less fat, salt and sugar) and more expensive to choose less healthy options within the same food group

<1> Strongly support
<2> Somewhat support
<3> Strongly oppose
<4> Somewhat oppose
<5> Don't know

Table C1. YouGov variables description

Variables	Description
age	Age
profile_gender	Gender
profile_socialgrade_cie	Social Grade (Chief Income Earner) A / B / C1 / C2 / D / E
profile_GOR	Region lived
voted_ge_2019	Talking to people about the General Election in December 2019, we have found that a lot of people didn't manage to vote. How about you – did you manage to vote in the General Election?
pastvote_ge_2019	Which party did you vote for at the General Election in December 2019?
pastvote_EURef	Past vote 2016 EU referendum
Weight	Weight
FF1	Generally speaking, would you support or oppose a higher tax on unhealthy foods?
FF2	And would you support or oppose a higher tax on unhealthy foods if the money raised was used directly to help make healthier food cheaper?
FF3	How much, if at all, do you know about the following taxes and which food and drinks they are added to?
FF3_1	Value Added Tax (VAT)
FF3_2	Soft Drink Industry Levy (SDIL)
FF4	Which of the following foods do you think have and don't have VAT added to them?
FF4_1	Soft drinks
FF4_2	Bottled water
FF4_3	Fresh meat
FF4_4	Processed meat (e.g. ham)
FF4_5	Cakes
FF4_6	Chocolate and confectionery
FF4_7	Food eaten in restaurants and cafes
FF4_8	Hot takeaways and deliveries
FF5	Which of the following drinks do you think have and don't have Soft Drinks Industry Levy (SDIL) added to them?
FF5_1	Soft drinks
FF5_2	Bottled water
FF5_3	Fruit juice
FF5_4	Milkshakes
FF6	Do you think the following foods should or should not have a higher tax applied to them?
FF6_1	Milkshakes
FF6_2	Fruit juice
FF6_3	Fresh fruit and vegetables
FF6_4	Potato crisps
FF6_5	Red and processed meat
FF6_6	Cakes

FF6_7	Ready meals
FF6_8	Hot takeaways and deliveries
FF7	Some taxes are applied to products to specifically achieve certain goals, either through the revenue raised or by discouraging people to purchase those products and encouraging them to purchase others instead. Thinking about different goals that could
FF8	Would you support or oppose the following…
FF8_1	Making it less expensive for people to choose healthy foods (e.g. fruit and vegetables), and more expensive to choose less healthy foods (e.g. deserts, prepared meals)
FF8_2	Making it less expensive for people to choose healthier options within food groups (e.g. ready meals containing less fat, salt and sugar) and more expensive to choose less healthy options within the same food group
