ABSTRACT

Introduction: National Governing Bodies (NGBs) for sport in the United Kingdom (UK) are responsible for establishing standards and ensuring safe, inclusive participation for all athletes, including those living with chronic health conditions (CHCs). Despite recommendations to safeguard individuals with CHCs in sporting environments, the extent and quality of policy provision by UK-based NGBs remain unclear. This scoping review systematically examined the availability and content of health-related policies across NGBs, with a focus on support for athletes with diabetes and other CHCs.

Design: Scoping review.

Data Sources: Policy documents of NGBs were accessed through publicly available materials on their official websites. All NGBs were contacted by email to confirm the existence of relevant policies, and to request any policy documents not currently included on their website.

Eligibility Criteria: Sports were included if their NGB had a publicly accessible website.

Results: Of 185 NGBs, 20 (11%) had policy documents that mentioned diabetes, 14 (7.7%) asthma, 12 (6.6%) epilepsy, 4 (2.2%) allergies, and 54 (29.7%) transgender. Of the 20 NGBs with documents mentioning diabetes only 4 had dedicated diabetes policies. The remaining 16 referred to diabetes in broader documents.

Conclusion: Despite increasing emphasis on inclusion in sport, few NGBs have clear policies to support individuals with type 1 diabetes or other chronic conditions but a third of them have developed policies for transgender inclusion. We recommend the development of national policies for diabetes and other CHCs, which can be adapted by individual sporting bodies to suit the specific needs of their sport.

Keywords: Chronic diseases; health policy; physical activity; inclusion; participation.

What is already known?

- Regular physical activity reduces long-term complications, and improves well-being in people with chronic health conditions, including diabetes, however many people with diabetes are not meeting recommended levels of physical activity.

- National Governing Bodies play a key role in encouraging and supporting people with chronic health conditions to participate in physical activity and to ensure their safety.

- Coaches often lack the necessary skills to support individuals with chronic health conditions.

What this study adds?

- Out of 185 National Governing Bodies in the United Kingdom, only four (2%) have dedicated policies to support people with diabetes.

- There is similar lack of support for people with epilepsy, asthma, and severe allergies.

How this study might affect research, practice or policy

- We recommend a national diabetes sporting policy is developed that can be modified by National Governing Bodies to reflect the needs of their specific context.

- Similar policies should also be introduced for other common chronic health conditions, including epilepsy, asthma, and severe allergies.

Equity, diversity, and inclusion statement
The author group is gender balanced and consists of junior and senior researchers from a range of disciplines and ethnic backgrounds, based in the UK and one African country. Our study population included sports organisations in the UK; thus, findings may not be generalisable to settings with fewer resources.

INTRODUCTION

The prevalence of chronic health conditions (CHCs), such as type 1 diabetes (T1D), asthma, epilepsy, and severe allergies, has increased over recent decades (1–3). In England, it has been estimated that at least one in four children has a CHC before turning 16 years old (4). CHCs affect many aspects of an individual's life and often persist into adulthood (5–7), resulting in significant personal and public health implications. CHCs also require ongoing management and present unique challenges for participation in physical activity (PA) – a key way to improve health-related quality of life (8).

PA is particularly important for people with at least one CHC, contributing to a range of benefits, such as: improved cardiovascular risk profile, enhanced psychosocial wellbeing, and better long-term health outcomes (9,10). For people with T1D, additional benefits include improved glycaemic control and a lower risk of long-term diabetes-related complications (2). Despite these benefits, people with CHCs, especially those with T1D, consistently report lower levels of PA compared to their peers (11,12). This can be attributed to a variety of internal and external factors, including: a lack of personal motivation; fear of hypoglycaemia; negative emotional responses (e.g., fear, low mood); uncertainty about safe PA practices/locations; and/or insufficient support from family and peers (13,14). Consequently, participation in PA among this population often depends on tailored support from sports organisations, coaches, and healthcare professionals. Robust policy guidance and inclusive PA environments are therefore essential – enabling equitable access and to maximise the health and social benefits of PA for all young people with CHCs.

In the United Kingdom (UK), National Governing Bodies (NGBs) oversee and regulate specific sports or activities at a national level. NGBs play an increasingly central role in developing, implementing, and monitoring policies that support the health and wellbeing of all participants (15), including those with CHCs, such as T1D. NGBs are also responsible for ensuring the safety of these individuals during their participation, as a fundamental duty of care (16,17). However, there have recently been news reports on participants from different sports and activities (e.g., football, cricket) who have died from T1D-related complications, most notably Diabetes Ketoacidosis (DKA) and hypoglycaemia (18,19). Evidence suggests that many coaches lack the knowledge and skills to support individuals with T1D effectively and are often unprepared to manage the stigma and/or specific challenges they face from PA participation (20). One way to address these challenges is for NGBs to implement policies that provide tailored advice and safety protocols for people with CHCs, as currently recommended by the World Health Organisation (21). Such an approach is well aligned to the fact that, under the UK Equality Act 2010, a CHC can be legally recognised as a disability – justifying the need for additional support and protection from discrimination.

Despite this recommended approach, there remains a perceived lack of structure and tailored provision to ensure the appropriate inclusion and support of individuals with T1D and other CHCs in the UK. The role of NGBs is therefore central to addressing this gap. Yet, across the 185 NGBs currently recognised by the five UK Sports Councils (i.e., Sport England, Sport Northern Ireland, Sport Scotland, Sport Wales, and UK Sport) (22), the policy landscape seems to have recently been disproportionately dominated by the creation (and revision) of transgender inclusion policies (23,24). In turn, this may have resulted in unintended oversight by NGBs to create and promote CHC-specific policies, including those targeting CHCs with direct implications for participation and safety, such as T1D, epilepsy, asthma, and severe allergies.

To date, no research has evaluated the prevalence or implementation of CHC-related policies among UK-based NGBs, nor has any study directly compared these with the better-documented developments in transgender inclusion policies.

This review therefore aims to examine the extent to which UK-based NGBs have developed publicly accessible policies to support individuals with T1D and other CHCs. It also compares these findings to the prevalence and content of existing UK-based NGB transgender inclusion policies. This comparative approach reflects the broader equity and inclusion agenda in sport and acknowledges that both groups—individuals with CHCs and those with a different gender identity than their sex registered at birth—face distinct but meaningful barriers to participation (24,25).

METHODS

This scoping review was based on the six-step methodological framework outlined by Arksey and O'Malley and informed by Levac et al. (26,27). The review was completed according to the Preferred Reporting Items for Systemic Review and Meta-Analysis (PRISMA) protocol, and using the PRISMA extension for scoping reviews (PRISMA-ScR) checklist (28). Details of the different stages were as follows:

Stage 1: identifying NGBs

All NGBs recognised by UK sports councils were included in the review (n = 185). The Sport England list of NGBs (accessed July 2024) was used to identify NGBs for inclusion (22).

Stages 2 and 3: identifying relevant policies and policy selection

The websites of the NGBs recognised by UK sports councils were manually searched between July and August 2024 to find any documents or policies addressing people with CHCs. Websites were independently searched using keywords "diabetes," "asthma," "allergy," "epilepsy," and "transgender" by three reviewers (MA-M, EC, RA) to identify policies and mentions of these CHCs.

Following this web search, each NGB was sent an email query to confirm whether they have any policies or guidance documents for the searched CHCs, and to request copies of the documents (if not found on their website). A reminder email was sent after two weeks to those NGBs that did not respond to the original email. Once a response was received, any relevant documents were downloaded, and notes were made around the wording of short web-based policies.

Stages 4 and 5: charting the data and collating, summarizing and reporting results

For each NGB, the following data were collected: whether official policies existed for diabetes, asthma, allergies, epilepsy, and transgender people; the exact wording of any relevant policy statements where a dedicated policy document was not available. Offline copies were downloaded for any health declaration forms used. If separate policies were not found online, broader documents were reviewed – such as safeguarding policies, risk assessment policies, and event guidelines – for any references to these conditions. Where relevant references were found, the information was recorded. All data were systematically documented in Microsoft Excel (software details) to allow for comparison and analysis across NGBs.

Patient and public involvement
The research team includes individuals with direct personal experience of T1D, ensuring that interpretations and recommendations are grounded in real-world relevance and priorities.

RESULTS

Of the 185 UK-based NGBs identified, 184 had working websites. Of these 184, a total of 176 NGBs were successfully contacted, 137 via email and 39 through online contact forms. The eight remaining NBGs were not contactable due to lack of email or online contact form (n = 2) or bounced/failed form or online contact form (n = 6). Thirty-three of the successfully contacted NGBs (19%) responded to our enquiries. Details shown in Figure 1.

Overview of published policies
An overview of the number of NGBs with policies relating to different CHCs is shown in Figure 2 and described below. A summary of the content of policies relating to diabetes, asthma, epilepsy, and allergies can be found in Table 1.

Diabetes
Out of 185 NGBs, only 20 (11%) included some mention of diabetes on their websites or in their policy documents (Table 1). Only 4 (2%) had dedicated policy documents relating to supporting people with diabetes, including: (1)the British Horse Racing Authority; (2) British Sub-Aqua Club; (3) Swim England; and (4) the Lawn Tennis Association.

The remaining 16 NGBs with some mention of diabetes included short advice for people with diabetes in other documents, such as: (1) equality, diversity and inclusion policies (n = 1); (2) safeguarding policies (n = 5); (3) event guidance documents (n = 9); and (4) risk assessment and safety policies (n = 5). Eleven NGBs included a question asking about diabetes in their health registration and/or health declaration forms. None of the 20 NGBs specified whether insulin use must be declared under a Therapeutic Use Exemption (TUE). However, two organisations - British Judo and Northern Ireland Judo - included brief guidance on the use of insulin pumps within their event documentation. Details of types of documents in which diabetes was mentioned is summarised in Figure 3.

Asthma
Fourteen NGBs (8%) mentioned asthma, but only one - British Sub-Aqua Club - had a dedicated policy and one - Swim England - had a guidance webpage. As with diabetes, the other 12 included short advice as part of other policy documents. Additional details can be found in table 1.

Epilepsy
Twelve NGBs (7%) mentioned epilepsy, but only one - Swim England - had a dedicated guidance webpage. As for diabetes and asthma, all other mentions were in different policy documents. Additional details can be found in table 1.

Allergies
Four NGBs (2%) mentioned allergies, and only two - British Weightlifting and British Wheelchair Basketball - had dedicated policies. The others were brief mentions in other policy documents. Additional details can be found in table 1.

Transgender
A total of 54 (30%) NGBs mentioned transgender, and all of these had dedicated policy documents for supporting transgender athletes.

Review of NGB diabetes-related advice and policy wording

Most guidance provided in diabetes policies focused on equipping athletes with the knowledge and skills needed to manage their diabetes, and emphasises the involvement of appropriate personnel (e.g., coaches, event organisers). For example, the British Hang Gliding and Paragliding Association's advice on their "Learn to Fly" page is as follows:

"If you suffer from any medical condition such as epilepsy, fainting, giddiness, high blood pressure, heart condition or diabetes you should ask your Doctor's advice."

Similarly, Badminton England offers the following advice as part of their Safeguarding Guidance document:

"If any of the group have asthma, diabetes, severe allergies or any other condition, ensure that appropriate personnel travelling with the group are aware of how to deal with any given situation."

Several documents recommended that people with diabetes seek medical clearance from their doctor before participating in PA. For example, the British Kendo Association's Return to Practice document states:

"Who Should Not Participate/Attend?
People with underlying conditions such as diabetes, heart disease, …, etc. If people with these conditions intend to participate consent from a doctor should be obtained beforehand."

Other policies direct their advice towards coaches and instructors, advising them to remain vigilant for participants with diabetes, recognise signs of hypoglycaemia, and to be prepared for emergency situations, though often without specific detail. Examples include UK Brazilian Jiu Jitsu Association's Code of Conduct, which included the following statement:

"The coach should also be aware if participants have long-term medical conditions such as epilepsy, diabetes or asthma. As a coach you should consider the participants' specific needs; what they can do as well as what they cannot do and the barriers they face to participation. There are certain medical conditions that may inhibit participation; coaches are advised to seek professional advice (from student's doctor/consultant in first instance as well as specialized sports bodies) before attempting to devise a training programme."

British Taekwondo Council's Equity policy stated the following:

"Instructors working with students with diabetes should be aware: (1) of the symptoms associated with the onset of hypoglycaemia (2) that a person with diabetes may carry with them a bag containing a blood glucose testing kit, food, glucose tablets, drinks etc, which he/she should be allowed to use as and when necessary (3) that training programmes should be built up gradually"

Among the four NGBs with dedicated diabetes policies, the covered topics included: (1) fitness to exercise (British Horse Racing Authority and British Sub-Aqua Club); (2) risks of hypoglycaemia and hyperglycaemia (British Sub-Aqua Club, Swim England, Lawn Tennis Association); (3) checking blood sugar before, during, and after exercise (British Sub-Aqua Club, British Horse Racing Authority, Swim England); (4) emergency treatment of hypoglycaemia (British Sub-Aqua Club, Swim England, Lawn Tennis Association),; (5) nutritional advice and hydration (British Sub-Aqua Club, Lawn Tennis Association); (6) safety measures during physical activity (British Sub-Aqua Club, British Horse Racing Authority, Swim England, Lawn Tennis Association); and (7) and adjustments to diabetes treatment (Swim England).

These examples highlight a general focus on risk awareness and medical oversight but often lack detailed and practical guidance specifically tailored for coaches, event organisers, and/or for the safe and inclusive integration of athletes with diabetes into PA environments.

Discussion

This scoping review reveals a substantial policy gap in UK sport: only four (2%) NGBs maintain dedicated guidance for participants with diabetes, with similarly limited provision for asthma, epilepsy, and severe allergies. This lack of dedicated guidance is despite clear World Health Organization recommendations for safeguarding individuals with CHCs in PA settings. This absence of tailored policy is particularly concerning given the pivotal role NGBs play in setting national standards, guiding practice, and ensuring the safety of participants with long-term health issues. By failing to prioritise the needs of people with CHCs, most NGBs miss opportunities to remove barriers to participation, support positive health outcomes, and fulfil legal and ethical responsibilities (29,30).

Robust policy at the national level is essential for driving meaningful culture change across all levels of physical activity. Where NGBs lead with clear standards for inclusion, these expectations are likely to cascade down to local clubs and coaches. Conversely, the absence of policy results in fragmented practice, limited awareness, and missed opportunities to support those with additional health needs. Evidence from Sport England's local delivery pilots confirms the power of national strategy to influence local outcomes and reduce physical inactivity(31). Creating a culture of inclusion also depends on psychological safety; where staff, coaches and athletes feel empowered to raise concerns and challenge practices that may compromise wellbeing. As Knott et al. highlight, safeguarding and ethical sport require more than policies; they demand a shared, relational culture where dialogue and reflection are normalised, and where whistleblowing does not carry personal risk (32).

A further concern is the limited accessibility of existing documents. In many cases, reference to CHCs were embedded in broader safeguarding or EDI policies and were difficult to locate without specific keyword searches. For policies to be effective, they must be clearly labelled, readily accessible, and available from NGB homepages. Without visibility, implementation becomes unlikely.

The benefits of clear policy provision are well established across sectors. As Skiba notes, in business settings, clear policies ensure legal compliance, provide guidance for staff, set expectations for behaviour and performance, and improve productivity (33). Applying these principles to NGBs, accessible policies offer staff, volunteers, and participants ready access to guidance, which develops confidence, consistency, and compliance in day-to-day operations. This

is particularly important in sport, where staff and volunteers may have varying levels of experience and training. If policies are difficult to find, overly complex, or not communicated clearly, they risk being misunderstood or ignored, undermining both compliance and the culture of inclusion that these policies are designed to promote. Ultimately, accessible policies are not just a compliance requirement, they are a cornerstone of effective governance, inclusion, and organisational success.

It is encouraging that 54 out of 185 NGBs in the UK have developed policies for transgender inclusion, aligning with international frameworks such as the IOC's position on fairness and non-discrimination (34). However, this level of policy development has not been extended to individuals with diabetes or other CHCs. The absence of such guidance risks perpetuating inequity and exclusion for people with chronic conditions, despite their high prevalence and significant impact on participation and safety in sport.

Recent initiatives, such as those led by Breakthrough T1D, underscore the value of co-producing resources with individuals who have lived experience of chronic disease to address this policy gap. Their collaborations with NGBs, including the Football Association of Wales and the Lawn Tennis Association, have demonstrated how integrating community insight can lead to practical outcomes, such as the development of condition-specific guidance for coaches and athletes that improves support and reduces stigma in sport (35). Expert recommendations and international frameworks advocate for the creation of clear, practical, and inclusive policies to guide both athletes and support staff. Nationally endorsed CHC policy templates, tailored to sport-specific contexts, could help ensure consistency, facilitate uptake across disciplines, and uphold the legal duties of NGBs under equality legislation.

Relating to diabetes recommendations, such as those by Hornsby & Chetlin, emphasise that athletes with diabetes should receive specific advice on glucose monitoring and any necessary insulin or dietary adjustments when exercising (36). Extending this approach to other CHCs, it is essential for NGBs to develop clear, practical policies to guide both athletes and coaches. These policies should be informed by national and international professional bodies, supporting safe and inclusive participation.

According to the National Athletic Trainers' Association (NATA) and the International Diabetes Federation (IDF), every athlete with diabetes should have a care plan that covers glucose monitoring, recognition and treatment of hypo- and hyperglycaemia, nutritional advice, insulin dose modification, travel, footcare, and compliance with anti-doping regulations (37). A dedicated diabetes sports policy should include all of the above, in addition to information on anti-doping regulations relevant to athletes with diabetes, ensuring compliance with governing bodies such as the World Anti-Doping Agency (WADA). However, our findings show that most advice for people with chronic diseases is embedded within broader documents-such as risk assessments, safety, or equality, diversity and inclusion (EDI) policies-and often places the onus on individuals to obtain medical clearance and inform coaches of their condition. The term 'incident' was frequently undefined, and even the four dedicated diabetes policies lacked guidance on insulin or insulin pump management during exercise. For example, the Judo association's event guidance mentioned insulin pumps only to ban their use in competition, without offering alternatives or directing athletes to further advice. This is not inclusion, it is exclusion by omission.

It is also essential to avoid unnecessary barriers. Routine medical clearance is not usually needed for people with T1D doing moderate exercise, unless they have heart symptoms or conditions, plan high-intensity or endurance activities, or take part in sports requiring clearance, like scuba diving (38). However, semi-professional and professional athletes benefit significantly from consultation with a diabetes specialist, particularly one with expertise in sport or exercise physiology. Managing T1D in this context involves personalised adjustments to insulin regimens, carbohydrate intake, and glucose monitoring to minimise the risk of hypoglycaemia and hyperglycaemia (39).

Some centres have established dedicated "diabetes sports clinics" to support athletes, providing education on new technologies, travel, competition, and injury recovery. These clinics also facilitate the submission of Therapeutic Use Exemption (TUE) forms. Diabetes-specific sports policies should incorporate this expert advice and extend it to coaches, event organisers, and other relevant personnel, thereby enhancing safety, supporting informed decision-making, and promoting the full inclusion of individuals with diabetes in sport at all levels.

Research/Policy Implications

This review demonstrates that most UK-based NGBs lack clear and easily accessible policies to support athletes with diabetes and other CHCs. This absence has important implications for both policy and research. At a policy level, there is a need for NGBs to create dedicated, visible, and practical guidance for these groups, rather than relying on brief references hidden within broader safeguarding or diversity documents. Making such policies prominent and comprehensive will help coaches and clubs to better protect the health and wellbeing of participants with CHCs, as well as meet their legal and ethical obligations under the Equality Act 2010.

Looking ahead, this issue is only set to grow in importance. The Health Foundation's projections (40)suggest that by 2040, nearly one in five adults in England will be living with major illness, with conditions like diabetes seeing some of the largest increases. Failure to act now to embed inclusive sport policies will likely exacerbate future inequalities in access to physical activity, especially as more people are living with complex health needs.

From a research perspective, future work should explore the real-world impacts of better policy implementation, including whether clearer guidance increases participation, improves safety, or reduces stigma for these athletes. There is also a need to understand what barriers currently prevent the introduction or effective dissemination of such policies within sports organisations. Further qualitative research may help clarify the views and needs of athletes, coaches, and administrators. Altogether, progress in these areas will be essential to ensure that all people with CHCs can access and benefit from safe, inclusive sporting environments

Limitations

This review offers a novel and comprehensive assessment of publicly available health-related policies among UK-based NGBs regarding diabetes, asthma, epilepsy, and severe allergies. Nevertheless, several limitations should be noted.

First, the scope was limited to NGBs within the UK The findings may, therefore, not be applicable to sports organisations in other countries where policy frameworks, resources, or digital access differ. Comparative studies in international contexts are needed to address this gap. Second, the analysis included only online and publicly accessible policy documents. Some NGBs may have

relevant internal or unpublished materials that were not identified. Moreover, not all NGBs responded to our enquiries, meaning that lack of visible policy does not necessarily imply a complete absence of policy. Lastly, this review did not assess how existing policies are implemented or their real-world impact. The existence of a policy does not guarantee its use or effectiveness in practice. Further research should examine how these policies are enacted at both grassroots and elite levels, and whether they improve inclusion, safety, and participant outcomes.

CONCLUSION

This review highlights a significant gap in UK sport policy, with only a handful of NGBs offering dedicated support for diabetes and other CHCs, despite the clear benefits of PA. People with CHCs remain under-protected due to the lack of practical, nationally developed policies. There is an urgent need for clear, evidence-based guidance that all NGBs can adopt to ensure safe and inclusive participation. Without such action, unnecessary barriers will persist, and sport will remain less accessible and equitable than it should be.

Figure 1: flow diagram of study information

Figure 1: The websites of 185 UK sports organisations were screened for relevant policy documents. One organisation did not have a website. We were able to contact 176 organisations to confirm the presence of policies and to request any unpublished documents; eight could not be contacted due to issues with their webforms or email addresses. A reminder email was sent after two weeks to non-responders. In total, we received 88 responses — 55 were automated replies and 33 were written email responses

Figure 2: Number of National sporting bodies with a policy on Type 1 diabetes, asthma, epilepsy and transgender

Figure 2: Number of sporting bodies with a policy on type 1 diabetes, asthma, epilepsy, and transgender inclusion. Percentages shown in brackets represent the proportion of organisations with a policy, based on the total number of sporting bodies assessed (n = 184)

Figure 3: Types of documents in which diabetes was mentioned

Figure 3: Types of documents in which diabetes was mentioned. Only four organisations had dedicated diabetes policies. Three of these, along with an additional sixteen organisations, included diabetes-related guidance within other documents.
EDI: Equality, Diversity & Inclusion

Table 1 – NGB's with policies relating to diabetes, asthma, epilepsy and allergies

Organisation	Diabetes policy			Policy summary of other conditions		
	specific policy	Policy summary	included in health declaration or registration forms?	Asthma	Epilepsy	Allergy
British Hang Gliding and Paragliding Association	No	Brief advise, asks people with diabetes to consult with a doctor before learning to fly	Yes	n/a	Brief advise, asks people with epilepsy to consult with a doctor before learning to fly	n/a
British Skydiving	No	Brief advise, focuses on hypoglycaemia and self-testing before each takeoff	Yes	Brief advise, well controlled symptoms are acceptable before skydiving	Brief advise, tandem diving is possible with controlled symptoms and medical clearance	n/a
Badminton England	No	Advise in Safeguarding guidance. Asks people with diabetes to ensure appropriate personnel are aware of how to deal with any issues	No	Asks people with asthma to ensure appropriate personnel are aware of how to deal with any issues	Mentioned in Safeguarding advice as example of conditions that can affect ability to make decisions	n/a
UK Brazilian Jiu Jitsu Association	No	Brief advise to coaches to be aware of participants with diabetes and their needs	No	Brief advise to coaches to be aware of participants with asthma and their needs	Brief advise to coaches to be aware of participants with epilepsy and their needs	n/a
