Abstract

Aims: To describe the Norwegian Sports Membership Database (NSMD), assess its coverage and develop definitions of sports participation for research purposes.

Methods: We validated the coverage of NSMD, a database capturing individual-level sports memberships among persons 10 to 70 years of age between 2015 and 2024, by comparing yearly membership counts with official reports from The Norwegian Olympic and Paralympic Committee and Confederation of Sports (NIF). We defined three operational thresholds for active membership: wide (≥ 1 day), intermediate (≥ 90 days), and strict (≥ 1 season or paid licence).

Result: Between 2015 and 2024, NSMD contained 2,850,802 memberships representing 1,396,467 unique individuals (49%) across 55 sports federations and 279 disciplines. Football accounted for 24% of memberships, handball for 11%, and skiing for 7%. Database coverage was low in 2015, capturing less than 20% of expected memberships, but improved substantially over time and exceeded 66% in 2019. The coverage further exceeded 89% from 2021. Of all recorded memberships, 99% met the wide definition criteria, 91% met the intermediate definition, and 80% met the strict definition.

Conclusion: The coverage of the NSMD is high in recent years, representing a level of completeness that permits meaningful population-level analyses from 2019, although with large variations between sports. Linking sports data with health and sociodemographic outcomes provides a potentially large opportunity for population-based research on sports participation and health across the lifespan.

Introduction

Population-based registries in general, such as health care registries, have been an invaluable resource for researchers, policymakers, and other stakeholders[1]. During the pandemic, registries were central in creating rapid statistics, surveillance and tracking outbreaks within occupations[2], schools[3], and nursing homes[4]. They have provided unique opportunities to study large populations over time[5–7], to identify risk factors[8], and to evaluate interventions in real-world settings[9]. Such registries have been particularly powerful when they can be linked with other administrative data sources, such as education or tax records, enabling analyses that cut across different domains of society. However, despite the well-documented value of registries in other fields, no comparable population-level data sources currently exist for organized sports participation. This represents a significant gap, given the potential of such data to inform research on physical activity, social inequality, public health, and policy development. Establishing registries for organized sports could therefore open new avenues for interdisciplinary research and provide an important complement to existing health and administrative data sources.

In this paper we present the Norwegian Sports Membership Database (NSMD) administered by the Norwegian Olympic and Paralympic Committee and Confederation of Sports (NIF). This database covers all recorded memberships in organized sports in Norway between 2015 and 2024. The database provides a unique opportunity to track sports participation over time, providing detailed insights into new, ongoing, and discontinued memberships in more than 50 sports. By linking this database to other

national registries, researchers can conduct longitudinal studies on sports participation together with socio-economy and health.

The main objective of this paper is to describe the content of the NSMD, with a special focus on coverage, differences between sports, and ways of defining sports participation.

Methods

Data source and collection

The NSMD covers all identifiable membership records in organized sports in Norway. Each membership record is linked to an individual's national identity number. This identity number is unique to all Norwegian residents and is key in allowing integration with other data sources and registries[10]. NSMD was gradually established from 2015, following NIF's mandate requiring all sport federations in Norway to adopt membership systems compatible with this centralized database[11].

The sample from NSMD used in this description included all sport memberships for members aged 10 to 70 years between January 1st, 2015 and October 31st, 2024. Each record contained detailed information on start date, end date, sport, and discipline (see Table 1). The unstructured nature of the NSMD allows members to be registered with several memberships in the same sport with overlapping start and end dates. In reality, this may reflect participating in different clubs at the same time, a change of club with a delayed de-registration from the previous club, or potential errors in the registration. The database contained no missing values but end dates may have been absent if the membership was still active at the time of data extraction, October 31st, 2024.

In addition to the main dataset, the NSMD contains a separate linkable dataset with information on paid licences. These licences cover insurance and are usually required from the year a child turns 13 in order to play games and compete in tournaments[12]. The licence dataset contains each member's national identity number, sport, and the licence's expiration date. The start date is defined as one year prior to the expiration date.

To provide a thorough description of the available data, we linked each person to their registered sex, age, county of residence, and country of birth from The Norwegian Population Register[10] along with their parents' income from Statistics Norway[13].

Statistical analysis

We first described the available data in NSMD, focusing on descriptive characteristics of all recorded memberships by sex, age, length of participation, and types of sports.

Table 1. Variables in NSMD.

Variables	Values
Start date	Date
End date	Date
Sport	Sports federation; 1 of 55 (e.g. ski)
Discipline	Discipline; 1 of 279 (e.g. alpine skiing)
Licence	Date; expiration date (covering one year)

Note: An overview of all sports and disciplines are available in S-Table 1 in Supplementary Information 1.

We then assessed the coverage of NSMD by comparing the number of unique members in NSMD with the total number of members reported by NIF in their annual reports[14]. NSMD data were sourced directly from administrative membership records, while NIF's annual reports were aggregated counts submitted by federations and clubs without requiring the national identity number of the members. Because NIF only reports totals by predefined age groups, we focused on 13–19-year-olds in 2015–2023. To count the total number of members in NSMD, we defined a member as anyone registered in at least one organized sport for at least one day during the calendar year in which they were aged 13–19.

After estimating coverage, we examined whether registered members in low-coverage years differed from those in high-coverage years. Based on already calculated coverage rates, we classified sports and years into four groups: low (0-39%), fair (40-59%), moderate (60-79%), and high (80-100%) coverage, using terminology from Norwegian medical quality registers[15]. We then investigated whether age, geography, and socio-economy varied over time within sports, as this could indicate whether using data from years with low coverage would induce certain biases.

Finally, to distinguish between active and non-active members, we provided three definitions of participation based on commitment and degree of activity, using both membership length and information on paid licences. The wide definition covered all memberships longer than 1 day. The intermediate definition was based on being a regular member[16,17], here defined as a minimum of 90 days. The strict definition was based on NIF's definition of active members as those with a paid licence or a membership lasting a full season[18]. We defined seasons in each sport based on their main competitive season: February-November for sports with summer seasons (e.g., football, athletics, cycling, martial arts) and September-June for sports with winter seasons (e.g., handball, skiing,

gymnastics, and motor sports). Supplementary information 1 contains a more detailed description.

All data management was conducted in R version 4.4.1 using Rstudio. R-scripts are available on GitHub together with an example dataset showing the structure of the data files: https://github.com/MethiF/2025_The_Norwegian_Sports_Membership_Database.

Ethical considerations

Ethical approval for the NorSport-project[19] was granted by the Regional Committees for Medical Research Ethics South East Norway on August 23rd, 2023 (reference #584239).

Results

Descriptive results

Between 2015 and 2024, there were 2,852,802 registered sports memberships in NSMD, corresponding to 1,396,467 (49.0%) unique individuals aged 10 to 70 years. Table 2 presents descriptive statistics for all memberships registered in the database. Overall, 57% of members were male, 91% were born in Norway, and most (>70%) memberships lasted more than a year.

Figure 1 shows the age distribution of all ongoing memberships, based on whether an individual held a membership in the year they reached each given age. The bars show the age distribution for all members, while the blue and red lines show smoothed distributions for males and females. For both sexes, sports memberships peak at the age of 11. Membership rates then rapidly decline until the age of approximately 25, with a slight increase for 40- and 50-year-olds, which may be a result of either a resurge in senior athletes, or the inclusion administrative members such as coaches, volunteers, or board members. This also corresponds with age distributions from NIF reports[14].

Coverage

The purpose of the NSMD has since its establishment in 2015 been to cover all registered memberships in organized sports in Norway. Panel A in Figure 2 shows that the number of registered members has gradually increased from 2015 to 2024, reflecting an increased coverage of the database. By comparing numbers in NSMD to numbers from official reports, we found that the coverage ranges from low (19% and 36%) in 2015 and 2016,

Table 2. Descriptive statistics of memberships in NSMD.

Characteristics	Overall	Male	Female
Total memberships, n	2,850,802 (100)	1,639,055 (100)	1,211,747 (100)
Unique individuals, n (%)	1,396,467 (49.0)	801,679 (48.9)	594,788 (49.1)
Age categories, n (%)			
Children (10-12 years)	866,835 (30.4)	446,814 (27.3)	420,021 (34.7)
Adolescents (13-19 years)	601,684 (21.1)	327,284 (20.0)	274,400 (22.6)
Young adults (20-39 years)	716,120 (25.1)	430,431 (26.3)	285,689 (23.6)
Middle-aged (40-59 years)	576,475 (20.2)	369,130 (22.5)	207,345 (17.1)
Older adults (60-70 years)	89,688 (3.2)	65,396 (4.0)	24,292 (2.0)
Country of birth, n (%)			
Norway	2,595,036 (91.0)	1,481,163 (90.4)	1,115,230 (92.0)
Membership duration			
Mean days (SD)	932 (830)	976 (860)	873 (784)
Median days (IQR)	705 (314-1344)	731 (330-1412)	657 (294-1232)
Duration categories, n (%)			
Very short (1-30 days)	123,550 (4.3)	68,055 (4.2)	55,495 (4.6)
Short (31-90 days)	116,005 (4.1)	63,710 (3.9)	52,295 (4.3)
Medium (91-365 days)	599,811(21.0)	328,378 (20.0)	271,433 (22.4)
Long (>365 days)	2,011,436 (70.6)	1,178,912 (71.9)	832,524 (68.7)
Sports, n (%)			
Football	694,264 (24.4)	478,687 (29.2)	215,577 (17.8)
Handball	318,791 (11.2)	107,580 (6.6)	211,211 (17.4)
Skiing	194,274 (6.8)	116,242 (7.1)	78,032 (6.4)
Gymnastics	164,896 (5.8)	39,094 (2.4)	125,802 (10.4)
Athletics	119,349 (4.2)	64,504 (3.9)	54,845 (4.5)
Equestrian	103,191 (3.6)	10,238 (0.6)	92,953 (7.7)
Shooting	85,588 (3.0)	74,566 (4.5)	11,022 (0.9)
Motor sports	84,632 (3.0)	70,319 (4.3)	14,313 (1.2)
Cycling	77,870 (2.7)	60,932 (3.7)	16,938 (1.4)
Martial arts	68,651 (2.4)	43,999 (2.7)	24,652 (2.0)
(Other sports)	939,296 (32.9)	572,894 (35.0)	366,402 (30.2)

to fair (48% and 57%) in 2017 and 2018, to moderate (67% and 77%) in 2019 and 2020, and stabilizing at high around 90% (89%-92%) between 2021 and 2023. In Figure 2, we omitted sports that never exceeded 50% coverage, such as golf (7%), company sports (9%), university sports (11%), curling (25%), functional fitness (32%), multisport (34%), and squash (49%). Including the omitted sports in both the numerator and the denominator, the overall coverage reached 88% in 2022 and 87% in 2023.

Panel B in Figure 2 provides a detailed breakdown of the coverage of the ten most common sports among 13-19-year-olds in the NSMD. The majority of these ten sports, with the exception of swimming (71%) and volleyball (80%), came close to achieving 100% coverage by 2023. Notably, gymnastics exceeded 100% coverage for the years

Figure 1. Age distribution in NSMD.

Note: Members aged < 10 years are available in the database only if they are members also after they turn 10. However, they are not included in this study.

2021 to 2023. This may be a result of either low reporting from clubs, or late de-registration in the database. A similar plot for all sports is included in S-Figure 1.

In Supplementary Information 2 we assessed whether member characteristics differed systematically in years with low coverage compared to years with high coverage, which showed that age, geographic distribution, and parental income all appeared relatively similar within sports over time (S-Figures 2–4). The largest differences in registrations were observed between different sports (S-Figure 1).

Defining active memberships

Being a registered member in NSMD does not necessarily reflect being an *active* member, such as regularly attending practices and playing games. We have therefore defined sport participation in three ways, wide ($\geq$ 1 day), intermediate ($\geq$ 90 days), and strict ($\geq$ 1 season or paid licence).

When applying the membership definition to all memberships, we found that the wide definition covered 99.2% of all registered memberships in the NSMD. The remaining 0.8% were memberships shorter than 1 day, likely due to registration errors. The intermediate definition covered 91.3% of all memberships, ranging from 93.5% in shooting to 86.5% in gymnastics (Table 3). The strict definition, requiring participation

(a) Coverage of NSMD by year.

(b) Coverage of top 10 sports in NSMD by year.

Figure 2. Coverage of NSMD.

in a full season or a paid licence, covered 79.5% of all members. This ranged from 78.1% in shooting to 53.5% in gymnastics.

The characteristics of members who meet the criteria for the different definitions are included in S-Table 2. Both the proportion being female (42.3, 42.0, 41.5) and Norwegian-born (91.0, 91.1, 91.4) were relatively stable across the various membership definitions. Logically, the largest discrepancies were seen in the percentage of members being unique individuals (60.1, 62.9, 68.7) and the mean days of membership length (970, 1058, 1260).

Table 3. Different definitions of memberships.

	Wide definition	Intermediate definition	Strict definition
	$\geq$ 1 day	$\geq$ 90 days	$\geq$ 1 season or licence
Football	611 418 (99.2%)	560 250 (90.9%)	459 012 (74.4%)
Handball	280 471 (99.2%)	253 443 (89.6%)	209 888 (74.2%)
Skiing	161 161 (99.4%)	149 673 (92.3%)	117 719 (72.6%)
Gymnastics	129 916 (98.9%)	113 676 (86.5%)	70 348 (53.5%)
Athletics	93 910 (99.0%)	86 565 (91.2%)	71 331 (75.2%)
Shooting	67 991 (99.3%)	63 982 (93.5%)	53 462 (78.1%)
Climbing	61 685 (99.6%)	57 391 (92.7%)	47 246 (76.3%)
Bandy	56 517 (98.4%)	51 946 (90.4%)	42 650 (74.3%)
Tennis	55 334 (99.6%)	51 375 (92.4%)	42 286 (76.1%)
Motor sports	52 923 (99.1%)	49 213 (92.2%)	39 017 (73.1%)
Other sports in S-Table 3	708 140 (99.3%)	643 153 (90.8%)	500 433 (77.8%)
Total	2 279 466 (99.2%)	2 080 667 (91.3%)	1 653 392 (79.5%)

Note: For all members irrespective of age. Overlapping memberships are merged (explaining why these numbers differ from the numbers in Table 1). Further, student sports, company sports, golf, and multisport are removed. For the strict definition, seasons are defined either as winter (September to May) or summer (March to November) primarily based on their competitive season. Overview of seasons are included in S-Table 1. Descriptive characteristics of members meeting the various criteria are included in S-Table 2. Numbers for all sports are included in S-Table 3.

Discussion

In this paper, we have presented the Norwegian Sports Membership Database (NSMD), a database established to include all membership records in organized sports in Norway. Since its creation in 2015, NSMD contains 2,9 million memberships and 1,4 million unique individuals, spanning 55 sports federations and 279 sports disciplines. The assumed coverage of the database has improved greatly from 19% in 2015 to around 90% in years after 2021.

A key strength of the NSMD is the inclusion of all organized sport memberships for the entire Norwegian population, which allows for population-wide analyses across a broad range of sports. The longitudinal nature of the data enables researchers to track exposures and outcomes over time, studying events before, during, or after joining organized sports. With the ability to link these data to other Norwegian registries and data sources through the unique national identity number of each individual, researchers can explore sports participation in relation to socio-economic, health-related, and other types of outcomes [19].

Our descriptive analysis of the NSMD showed that organized sports participation is dominated by younger cohorts, as ongoing memberships peaked at 11 years of age both for males and females. This finding corresponds well with both NIF's reports [14] and studies from other countries [20].

Football is the largest sport, making up 24% of memberships, followed by handball (11%), skiing (7%), and gymnastics (6%). In reports by NIF, the top five sports in Norway are football, handball, golf, company sports, and skiing [14], but golf and company sports are not fully captured in the NSMD. Only 7% of golfers are included due to incomplete integration of the golf federation's membership system [21], and members in company sports, along with university sports, are usually recorded in the specific sport federation. However, both golf and company sports are more common among older ages and thus have little impact on studies of children and adolescents. In addition, most golf members do not follow the same type of organized, structured sports as most other sports, as being a registered and paying member of a club is required in order to get access to golf courses in Norway.

The coverage of NSMD varies substantially over time. By 2021, the coverage of most sports exceed 90%. This suggests that NSMD captures almost all memberships. Our assessment of demographic and socioeconomic distributions between years of low (<40%) and high (≥80%) coverage did only reveal minimal discrepancies (S-Figures 2–4). These variations were mainly influenced by the type of sport, rather than demographic and socioeconomic factors. This suggests that researchers may use, though with caution, the longitudinal data from e.g. 2015 to follow members over time without excluding particular sociodemographic groups.

When calculating coverage, we implicitly assumed that the numbers in NIF's annual reports are correct. However, these numbers are based on club submissions without a formal verification process. Since centralized funding is dependent on these numbers, there may be incentives to overreport actual numbers. Hence, from 2021 to 2024, the available numbers in NSMD may offer a more precise depiction of the actual number of sports memberships in Norway than NIF's reports. However, determining which of these sources is the most reliable remains challenging.

Although the strengths of the NSMD relate to the population-wide coverage, longitudinal aspects, and the ability to link it with other individual-level data, the data source also contains some limitations. The database is unstructured, leading to challenges such as overlapping information and duplicate entries, without the ability to determine whether these memberships, in fact, are overlapping or a result of an erroneous

registrations. In addition, there may be uncertainty surrounding actual participation levels. Being a registered member does not necessarily reflect active participation, as children or adults can cease attending practices before deregistration. We address this issue by incorporating licence data, which requires active payment to be able to participate in games and tournaments, and we provide three different membership levels: (1) wide definition, covering all memberships lasting more than one day; (2) intermediate definition, including memberships longer than 90 days; and (3) strict definition, covering memberships lasting at least one season or with a paid licence. The three definitions may serve to answer different questions. For instance, if we are interested in examining socio-economic barriers to sports participation, it may be logical to use the wide definition, including all members. However, if we are interested in studying, for example, the physical or psychosocial benefits of sustained participation, which in epidemiology is often referred to as a dose-response effect[22], we might require the intermediate or strict definition.

A final limitation is that the period the NSMD reached high quality, in 2021, coincided with the covid-19 pandemic. During the pandemic, Norway imposed extensive restrictions on organized sports[23,24]. Restrictions varied throughout the country, with stricter measures in urban areas with higher infection rates. Restrictions also differed between different sports, age groups, and levels of professional activity. Although NIF reports indicate a minor decrease in membership in 2020 and 2021[14], NSMD saw an increase in memberships during the same period, likely due to increasing coverage. A survey in 2022 revealed that while participation in organized sports decreased during the pandemic, participation in the same sports increased after the pandemic[25].

As compared to previous research, the large majority of studies on organized sports participation are from surveys with self-reported participation. A handful exceptions exist. For instance, researchers from Australia have used de-identified registration data for a limited number of sports to investigate ages, genders and whether sport members tend to live in urban or rural areas[20]. Similarly, an ongoing initiative in Norway uses membership data with birth dates to investigate the relative age effect in sports[26]. However, none of these projects involve the ability of linking the membership data to other registries on the individual level[19]. Hence the NSMD represents the first possibility of these types of studies.

Conclusion

In this paper, we have presented the Norwegian Sports Membership Database (NSMD), which covers all recorded and linkable memberships in organized sports in Norway from 2015–2024. Our findings suggest that the database is reliable from 2019 to 2024, covering more than two-thirds of all memberships, and particularly strong from 2021 to 2024, capturing around 90%.

The NSMD allows researchers to operationalise various definitions of active memberships according to their research questions. In this paper we have proposed three definitions: a wide definition capturing all memberships lasting more than one day (99% of registered memberships), an intermediate definition requiring at least 90 days of continuous membership (91%), and a strict definition based on seasonal participation or paid licences (80%).

Linking NSMD to administrative health and sociodemographic registries, enables longitudinal studies in which researchers can examine what happens before, during, and after individuals engage in different sports. This allows for investigation of dose-response relationships between sports participation and health outcomes, identification of barriers to participation across demographic groups, and comparison of health effects across sports and disciplines.

Contributions

FM, IHE, and KM designed the study. FM and IHE prepared the data. FM conducted all data analyses and drafted the manuscript. All authors (FM, IHE, JMK, AM, RKH, AF, KM) contributed to interpreting the results, and all authors revised the draft critically. Supervision was provided by KM. All authors approved the final version of the manuscript to be published and agree to be accountable for all aspects of the work.

Declaration of conflicting interests

The authors declare that they have no competing interests.

Funding

This work was funded by Foundation Dam, through Youth Mental Health Norway (grant number 2025/FOR555616). The funding bodies had no role in the design of the study, data collection, analysis, interpretation of data, or in writing the manuscript.

Acknowledgements

We would like to thank Terje Kleiven, Ingvild Reitan, and Guro Aurtande at the Norwegian Olympic and Paralympic Committee and Confederation of Sports (NIF) for thorough help and assistance in using and understanding the NSMD data. We would also like to thank Kjetil Telle, Kristian Bandlien Kraft, and Runar Barstad Solberg at the Norwegian Institute of Public Health (NIPH) for valuable feedback and comments during the drafting of the manuscript.

Supplemental material

This supplementary information contains the following:

- **Supplementary information 1: Determining seasons in different sports**
    - S-Table 1: Sports, Disciplines, Licences and Seasons in NSMD
- **Supplementary information 2: Detailed on coverage**
    - S-Figure 1: Coverage by type of sport
    - S-Figure 2: Coverage by age
    - S-Figure 3: Coverage by geography
    - S-Figure 4: Coverage by income
- **Supplementary information 3: Detailed on active members**
    - S-Table 2: Descriptive characteristics of members by various definitions
    - S-Table 3: Members by various definitions for all sports

Supplementary information 1: Determining seasons in different sports

Before the 21st century, sports were often classified as either winter or summer activities. For example, the Norwegian athlete Bjørn Wirkola excelled in ski jumping during the winter while also playing football for Rosenborg in the summer. Similarly, Laila Schou Nilsen achieved remarkable success across several disciplines: she won an Olympic medal in alpine skiing, two world championships in speed skating, multiple Norwegian tennis championships, and several national titles in handball. While these achievements were nothing short of extraordinary, they would be considered almost impossible today. This is because most sports have now become year-round activities, with competitive seasons that rarely pause.

o define an active member as someone participating for the duration of a full season, it is necessary to clarify what is meant by a "season". Based on the timing of matches, tournaments, and competitions, we categorized all 51 sports as having either a winter season (September–May) or a summer season (March–November). To ensure consistency, both summer and winter seasons were defined as spanning eight months, even though this may not perfectly reflect the competition period for every sport.

A member is considered a seasonal participant if:

- In winter sports: membership starts no later than the end of September in one year and continues beyond the beginning of May the following year.
- In summer sports: membership starts no later than the end of March and continues beyond the beginning of November the same year.

An exception was made for 2024, as membership data was censored on October 31st, 2024. In that case, ongoing memberships at the cut-off date were counted as active for summer sports. However, for winter sports, memberships that started before September 2024 but were only confirmed as ongoing on October 31st, 2024, were not defined as covering a full season.

S-Table 1 lists all sports (federations), the disciplines within each federation, whether the database contains licence information, and the defined season (winter or summer).

S-Table 1: Sports, Disciplines, Licences and Seasons in NSMD

Sport (federation)	Sport (English)	Disciplines (Norwegian)	Disciplines (English)*	License	Season
Ake og bob	Luge, bobsleigh and skeleton	Bob, Kunstbaneaking, Naturbaneaking, Skeleton	Bobsleigh, Natural track luge, Artificial track luge, Skeleton	No	Winter
Amerikanske idretter	American sports	Amerikansk fotball, Amerikanske idretter, Cheerleading, Disksport, Lacrosse	American football, American sports, Cheerleading, Frisbee sports, Lacrosse	Yes	Winter
Badminton	Badminton	Badminton	Badminton	No	Winter
Bandy	Bandy	Bandy, Hockey, Innebandy, Rinkbandy	Bandy, Floor hockey, Floorbandy, Rinkbandy	Yes	Winter
Basketball	Basketball	3MOT3, Basketball	3x3 basketball, Basketball	Yes	Winter
Bedrift	Company sport	Cageball, Mosjonsaktivitet bedrift, Ridning, Taekwondo, Yoga	Cageball, Exercise for companies, Horseback riding, Taekwondo, Yoga	No	–
Biljard	Billiards	Carambole, Pool, Biljard, Snooker	Carambole, Pool, Billiards, Snooker	No	Winter
Boksing	Boxing	Boksing	Boxing	No	Winter
Bordtennis	Table tennis	Bordtennis	Table tennis	Yes	Winter
Bowling	Bowling	Bowling	Bowling	Yes	Winter
Brett	Boardsports	Brett, Bølgesurf, Skateboard, Snowboard	Boardsports, Surfing, Skateboarding, Snowboarding	Yes	Winter
Bryting	Wrestling	Bryting, Fristil, Grappling, Gresk-Romersk, Håndbak, Sandbryting, Sumo	Wrestling, Freestyle wrestling, Grappling, Greco-Roman wrestling, Arm wrestling, Beach wrestling, Sumo wrestling	Yes	Winter
Bueskyting	Archery	Bueskyting, Ski-Bueskyting, Skivebueskyting, Skogsskyting (3D og Felt)	Archery, Ski archery, Target archery, Field and 3D archery	No	Winter
Casting	Casting	Casting, Fluekasting	Casting, Fly casting	No	Summer
Cricket	Cricket	Cricket	Cricket	Yes	Summer
Curling	Curling	Curling	Curling	No	Winter
Dans	Dancing	Dance Factory, Dans, Freestyle, Disco & Performing Arts, Linedance, Salsa, Sportsdans, Sportsdrill, Street styles, Swing og Rock'n Roll	Dance Factory, Dance, Freestyle, Disco & Performing Arts, Line dance, Salsa, DanceSport, Baton twirling, Street styles, Swing and Rock'n Roll	Yes	Summer
Dykking	Diving	Dykking, Finnesvømming, Foto og film, Fridykking, Undervannsjakt, Undervannsrugby	Scuba Diving, Finswimming, Underwater Photography and Film, Freediving, Spearfishing, Underwater Rugby	Yes	Winter
Fekting	Fencing	Fekting	Fencing	No	Winter
Fleridretter	Multisport	Boccia, Friskis & Svettis, Goalball, Kjelkehockey, Pétanque, Rullestolbasket, Rullestolrugby, Sittende volleyball, Teppecurling	Boccia, Friskis & Svettis, Goalball, Sledge Hockey, Pétanque, Wheelchair Basketball, Wheelchair Rugby, Sitting Volleyball, Floor Curling	No	–
Fotball	Football	Fotball, Futsal	Football, Futsal	No	Summer
Friidrett	Athletics	Friidrett, Friidrett på bane, Gang/mosjon/turmarsj, Kappgang, Løp utenfor bane, Øvrig friidrett	Athletics, Track and Field, Recreational Walking/Race Walking/Walking Events, Race Walking, Road and Cross-Country Running, Other Athletics	Yes	Summer
Functional Fitness	Functional Fitness	Functional Fitness	Functional Fitness	Yes	Summer
Golf	Golf	Golf	Golf	No	–
Gymnastikk og turn	Gymnastics	Gymnastikk og Breddeaktivitet, Gymnastikk og turn, Gymnastikkhjul, Parkour, Rytmisk gymnastikk, Trampoline, Troppsgymnastikk, Turn, Turn kvinner	General Gymnastics and Recreational Activity, Gymnastics and Artistic Gymnastics, Wheel Gymnastics, Parkour, Rhythmic Gymnastics, Trampoline, TeamGym, Artistic Gymnastics, Women's Artistic Gymnastics	Yes	Winter
Hundekjøring	Sled dog racing	Alle grener, Barmark, Hundekjøring, Nordisk stil, Sledehundkjøring, Snørekjøring, Åpen samling	Dryland Mushing, Dog Mushing, Nordic Style, Sled Dog Racing, Skijoring, Open Class	Yes	Winter
Håndball	Handball	Beach håndball, Håndball	Beach handball, handball	Yes	Winter
Ishockey	Ice hockey	In-line, Ishockey	In-line, Ice hockey	Yes	Winter
Judo	Judo	Judo	Judo	Yes	Summer

Sport (federation)	Sport (English)	Disciplines (Norwegian)	Disciplines (English)	Licence	Season

*Note: English names for disciplines have been translated to the best of our ability and may not necessarily reflect the correct terms.

Supplementary information 2: Detailed on coverage

Using membership data from years with low coverage may produce biased estimates if systematic differences exist between the members who are registered in low-coverage years and those in high-coverage years. An important question to consider is: if coverage is only 20%, which groups are actually included? For instance, does this 20% consist primarily of the oldest quintile, the wealthiest children, or participants from specific clubs or regions of the country? In such cases, estimates based on these years would be biased. However, if the missing memberships during these periods are missing completely at random (MCAR), the resulting estimates would remain unbiased.

To assess this, we compared the distributions of observable variables in years with high coverage (80%) against years with low (¡40%), fair (40–59%), and moderate coverage (60–79%). Specifically, we examined whether type of sport, age, geographic distribution, and parental income of registered members remained consistent across different coverage levels, stratified by the ten most common sports. S-Figure 1 presents coverage for all 55 sport federations. The figure demonstrates that most sports reach coverage exceeding 80% in later years, but also reveals considerable variation between federations.

For sociodemographic characteristics, we focused on the top ten sports among individuals aged 13–19. Visual inspections of distributions across years with varying coverage suggested that age, geographic location, and parental income remained relatively stable (S-Figures 2–4). Age distributions for the ten most common sports showed only minor variations (S-Figure 2), and geographic differences were similarly small.

For geographic differences we used Norwegian counties as the unit of observation. Between 2015 and 2024, Norway underwent several administrative reforms to its county structure. In this paper, we use the "2020 counties", as these align most closely with the Norwegian Olympic and Paralympic Committee and Confederation of Sports (NIF)'s regional sports federations. All with the exception of Troms and Finnmark, which constitute a single county but are represented by separate regional sports federations. Within this framework, we observed that Viken was slightly overrepresented in skiing and Rogaland slightly overrepresented in athletics during years with lower coverage quality (S-Figure 3). Conversely, Trøndelag was slightly underrepresented in skiing, while Oslo was underrepresented in athletics. However, these patterns may also reflect

S-Figure 1: Coverage by type of sport

genuine temporal shifts in participation trends. For instance, in recent years there may have been relatively fewer skiers from Viken and athletes from Rogaland, and relatively more participants from Trøndelag and Oslo.

Parental income distributions, by contrast, appeared almost identical within sports across years with different coverage levels (S-Figure 4). Parental income was defined as the combined annual gross income of both mother and father, lagged by one year and adjusted for inflation to 2022 NOK. The stability of these distributions across years suggests no major selection biases related to age, geography, or socio-economic status during periods of varying coverage quality.

We also conducted statistical t-tests comparing mean differences in age, geography, and income (not included). These tests revealed some significant disparities in specific sports. For example, in football and handball, mean age and income differed significantly across nearly all coverage-level comparisons, with the exception of football age when comparing years with good versus high coverage. Given that these are the two largest sports by membership, such results may partly reflect very small standard errors, making even minor differences statistically significant. By contrast, in basketball (income) and skiing (age), mean differences were never statistically significant.

S-Figure 2: Coverage by age

Supplementary information 3: Detailed on active members

NSMD covers all registered members regardless of length and activity level. In this paper, we have provided three definitions of membership, in order to reflect different levels of participation. The wide definition covers all memberships that last more than one day. This definition might be used if we want to include all members, but want to eliminate what is likely mis-registrations. For example, when studying barriers to participation or describing the total level of participation in Norway. The intermediate definition is based on previous definitions as an active member taking part for more than 4 weeks, or 28 days. However, these definitions are typically based on persons actively participating for 28 days. In our data, we cannot measure whether a person has taken part in practices or games. Hence, we prolong this period to a minimum of 90 days. On average, this includes 91% of all members. The strict definition is based on NIF's own definition, taking part in a full season or having a paid licence. There are several issues with this definition. The first issue is the definition of a 'season' in different sports. As described in Supplementary information 1, for most sports there are no clear-cut definition of when

S-Figure 3: Coverage by geography

a season start or end. Practices, games and tournaments often take part the whole year. This was also our experience when talking directly to the different sport federations in Norway. However, in order to make a coherent measure of a season, we defined this as either from September to May or from March to November, based on when the main competitive season takes place. The second issue is that licences are only available for children aged 13 or higher and only for some sports. Hence, for children aged 10–12, the strict definition will likely include fewer members as all of these will be based on participating a full season. For members aged 13 to 19 in sports with available licence data, we ran a correlation analysis between being a member a full season and having a paid licence. This revealed that 52% of all season members had a paid licence, and that 61% of all licence holders were members for at least one season.

The following tables contains descriptive characteristics of members by the three various definitions (S-Table 2) and the total number of members in each sport reaching

S-Figure 4: Coverage by income

the different membership criteria (S-Table 3). These tables include all individuals aged 10–70.

S-Table 2: Descriptive characteristics of members by various definitions.

	Wide definition	Intermediate definition	Strict definition
	≥ 1 day	≥ 90 days	≥ season or licence
Total memberships, n	2,279,466 (100)	2,080,667 (100)	1,653,392 (100)
Unique individuals, n (%)	1,370,590 (60.1)	1,308,169 (62.9)	1,135,147 (68.7)
Female, n (%)	964,701 (42.3)	874,463 (42.0)	686,322 (41.5)
Age categories, n (%)			
Children (10-12 years)	770,602 (33.8)	711,346 (34.2)	554,762 (33.6)
Adolescents (13-19 years)	467,534 (20.5)	422,644 (20.3)	343,821(20.8)
Young adults (20-39 years)	546,723 (24.0)	491,344 (23.6)	382,237 (23.1)
Middle-aged (40-59 years)	431,467 (18.9)	397,295 (19.1)	325,605 (19.7)
Older adults (60-70 years)	63,140 (2.8)	58,048 (2.8)	46,967 (2.8)
Country of birth, n (%)			
Norway	2,073,595 (91.0)	1,894,642 (91.1)	1,510,676 (91.4)
Membership duration			
Mean days (SD)	970 (849)	1058 (837)	1260 (823)
Median days (IQR)	699 (305-1400)	789 (384-1470)	1035 (653-1733)

S-Table 3: Members by various definitions for all sports.

	Wide definition	Intermediate definition	Strict definition
	$\geq$ 1 day	$\geq$ 90 days	$\geq$ season or licence
Football	611 418 (99.2%)	560 250 (90.9%)	459 012 (74.4%)
Handball	280 471 (99.2%)	253 443 (89.6%)	209 888 (74.2%)
Skiing	161 161 (99.4%)	149 673 (92.3%)	117 719 (72.6%)
Gymnastics	129 916 (98.9%)	113 676 (86.5%)	70 348 (53.5%)
Athletics	93 910 (99.0%)	86 565 (91.2%)	71 331 (75.2%)
Shooting	67 991 (99.3%)	63 982 (93.5%)	53 462 (78.1%)
Climbing	61 685 (99.6%)	57 391 (92.7%)	47 246 (76.3%)
