Summary

Introduction: This exploratory observational monocentric study investigates the perceptions and attitudes of medical students of the Faculty of Medicine and Pharmacy of Rabat (FMPR), a Moroccan public medical school, about the implementation of a curriculum using English language (EL) as medium of instruction (EMI). **Methods:** The sample comprised 102 medical students from the second curriculum levels. The survey used a questionnaire including 23 questions with a Likert scale and multiple-choice questions in four sections: descriptive demographic data, students' proficiency in EL, students' language perceptions and attitudes, and needs of EMI. A bivariate analysis and univariate and multivariate logistic regression analysis were performed to determine the effect of explanatory variables on the "EMI choice." **Results:** The sample included 102 medical postgraduate students from the second curriculum levels (65 females and 37 males). The majority of participants declared that they 'often' use in daily life the speaking skill of general EL and are often exposed to listening in EL, while they 'rarely' use writing and reading skills. Their perceived general EL competencies and listening and reading Academic skills were evaluated as "good". 92.2% were strongly in favor of implementing EMI in the FMPR. A significantly positive correlation was observed between "EMI choice" and the variables: age, course year, "I like learning EL", and "EL should be the language of higher education". There was a growing tendency for EMI choice as course year increased, with the highest percentage recorded between the 3rd and 4th years at 96.4%. The multivariate logistic regression revealed a statistically positive influence of the variables "Fourth course year", "I like learning EL", and "EL should be the language of higher education" on the EMI choice. **Conclusion:** The study highlighted general positive students' perceptions and attitudes towards the potential EMI implementation in the FMPR. The findings of this study have the potential to inform and inspire medical institutions across diverse countries, irrespective of differences or similarities in their educational and cultural environments, especially in settings where EL is not the primary language of instruction.

Key words: English As Medium of Instruction; Medical education; Perceptions; Attitudes; Higher education; Public Faculty of Medicine and Pharmacy.

Introduction

The twenty-first century is witnessing the establishment of English Language (EL) as the language of globalization. Despite the cultural variations, EL has been accepted among worldwide speakers in diverse fields. It is the medium of scientific research, medicine, education, trade, diplomacy, technology, tourism, and many other areas [1]. In the field of education, Macaro defined EMI as "the use of EL to teach academic subjects (other than English itself) in countries where the first language of the majority of the population is not English" [2]. In the world, there is an increased number of EMI programs in higher education [3]. The rationales motivating this recognition of EMI as the utmost importance are the access to global communication, the students' needs of high employability at the global market, the quality of education and research leading to the best universities ranking, and the cultural understanding, to name a few [4][3].

Morocco enjoys a diverse identity due to its position in African continent where most countries were former British colonies for the most, in MENA region which encompasses rich countries with important oil reserves, and North African countries which followed the EMI trend despite the common French colonial history. In Africa, beside the former British colonies where EL is widely used, even the countries that have been colonized by France, Germany and Portuguese, have adopted EMI because it is considered as a gateway to international education [5][6]. In MENA region, the countries of Middle- East that have a common profile of rich countries with oil reserves, Arabic Language (AL) as official language, and a large expatriate population invest efforts to transition from oil-based economy to a knowledge-based economy [5][7]. In their medical schools, EMI is widely implemented, bringing not only its advantages but also some transition issues with numerous high schools AL based learning [8]. In North-African countries, especially in Tunisia and Algeria, French Language (FL) holds a prominent place in education due to historical legacy of French colonialism. [5][9]. In the aim to meet the international medical standards, these countries are progressively adopting EMI programs in their medical schools while still maintaining FL as their primary medium [10][11]. In Libya, where AL is the main medium of instruction in higher education, there is a modest but growing interest in introducing EMI in medical curricula whereas in Egypt, EMI largely dominates in medical schools due to the British educational influence [12].

In Morocco, the government recently launched the Morocco's 2022-2026 roadmap for educational reform, the main pillar of which is the development of students and teachers' EL skills [13]. In higher education, many universities and colleges currently offer diverse programs in EL, attracting henceforth a large number of Moroccan and international students. By adopting this reform, Morocco aims to become more competitive in the international market, a fact reflected by the country's growing emphasis on globalization.

To the best of our knowledge, there is no study about perceptions and attitudes of Moroccan medical students, or other aspects of the implementation of EMI in Moroccan public faculties of medicine and pharmacy which attract students of different social classes, not necessarily having had the financial means to improve their EL proficiency.

The objectives of this study aim to explore the students' perceptions and attitudes towards a potential implementation of EMI at the Faculty of Medicine and Pharmacy of Rabat (FMPR), and their perceived EL proficiency to determine their readiness and preparedness for EMI. It addresses a key point: the implementation of EMI within a public faculty of medicine in Rabat, creating opportunities for globalization and potentially enhancing the doctoral career prospects of a heterogeneous student population, including both privileged and less affluent learners.

Methods

Study design

This research was an exploratory observational monocentric study conducted at the FMPR during the academic year 2023-2024. The primary objective was to explore the potential implementation of EMI. Specifically, the study aimed to analyze students' perceptions and attitudes towards EMI. In this context, we investigated students' perceived proficiency in the four EL skills (listening, reading, speaking, and writing) in both general and academic EL. An exploratory design was chosen because there is no prior research on implementing EMI in a public Faculty of Medicine and Pharmacy in Morocco. The observational aspect focused on collecting descriptive data from the sample. A quantitative approach was employed using a questionnaire with a Likert scale and multiple-choice questions. Based on the objectives outlined above, the research questions were as follows:

- What is the perceived EL proficiency of students in the four EL skills (i.e., listening, reading, speaking, and writing), and more specifically in academic EL?

- What are the students' perceptions and attitudes towards the implementation of EMI at the faculty of Medicine and Pharmacy of Rabat?

Participants

The target population consisted of students at the FMPR during the 2023-2024 academic year. The convenience sample comprised 102 medical postgraduate students from the second curriculum levels (3rd, 4th, 5th, and 6th years of study). This sample size was deemed acceptable for an exploratory research study. The inclusion criteria included all students proficient in FL or EL. The exclusion criteria consisted of students who declined to participate in the study.

Procedure

This study was conducted using a self-administered questionnaire to collect data from participants who provided informed consent. No identifying or sensitive personal information was collected, and responses were

submitted and gathered anonymously, ensuring that individual participants could not be traced, thereby preserving their anonymity. The questionnaire was edited in both FL and EL and distributed randomly to participants, allowing them to choose the language of the questionnaire. A total of 130 questionnaires was distributed. Of these, 28 were incompletely answered, leaving 102 valid for this study. The questionnaire was divided into four sections: the first section gathered demographic data about the students, the second section assessed students' proficiency in EL, starting with their background, usage (including both general and academic EL), and exposure to EL, focusing on the four main language skills. The third section explored students' perceptions and attitudes towards EMI. The fourth section investigated the students" needs in terms of EMI and will be used in a future research.

The validity and reliability of the questionnaire were assessed using experts' opinion and Cronbach's alpha scores. Initially, a pilot questionnaire test was administered to a subset of the target population, consisting of fifteen respondents, to evaluate face validity. All respondents confirmed that there were no issues with the questions regarding clarity, relevance, or comprehensibility. To refine the questionnaire design and ensure content validity, it was reviewed by six experts, three of them are professors of Medicine and experts in Research Methodology, and three others are professors of English Studies in higher education and EMI research experts. The questionnaire was refined based on expert recommendations and approved by them. To ensure reliability and achieve optimal results, internal consistency was evaluated using Cronbach's alpha. For exploratory research, a Cronbach's alpha cut-off score of 0.50 is generally accepted [14] [15]. Table 1 presents the Cronbach's alpha scores for the different dimensions of the questionnaire.

Statistical analysis

Statistical analysis was performed using Jamovi 2.6.26 software. Descriptive analysis was employed for each variable in the questionnaire. Quantitative variables with non-Gaussian distributions were expressed as medians and interquartile ranges. Qualitative variables were expressed as numbers and frequencies. A bivariate analysis was conducted using the chi-square test and Fisher's exact test. We completed the bivariate analysis by a univariate and a multivariate logistic regression to determine the effect of explanatory variables on the dependent variable "EMI choice." A p-value less than 0.05 was considered statistically significant. Associations were expressed as odds ratios with a 95% confidence interval.

Results

The sample included 102 participants, with 65 females (63.7%) and 37 males (36.3%). The age range of the participants was between 20 and 25 years, a median age of 21 years [21-23]. 38. 2% were in their third year of study, 27.5% in their fourth year of study, 19.6% in their fifth year of study, and 13.7% in their sixth year of study. Demographic characteristics of the students are summarized in figures 1 and 2.

The majority of participants declared to speak EL (93.1%), 52% started at primary school while 34.3% received their first courses at secondary school. 28.4 % got a certified EL level aligned with the Common European

Framework of Reference for Languages (CEFR), namely B2 (9.8%), C1(9.8%) and C2(4.9%). All the participants declared having "often" the opportunity to practice the skills of speaking and listening via some habits, such as interacting with friends, watching TV, listening to English songs or podcasts, while they are more "rarely" exposed to situations where reading and writing are involved (Table 2).

Responding to some questions related to general EL competencies, the majority of participants evaluated their abilities as "good." However, their perceptions were more variable concerning their Academic EL skills (Table 3). Participants rated their listening and reading skills as "good," while their speaking and writing skills were considered "average." Particularly, participants who considered their ability to write a scientific article as "basic" made up the majority. A minority of students expressed fear about facing challenging difficulties, such as understanding lectures (10.8%), understanding EL medical textbooks (16.7%), participating in class discussions (28.4%), writing assignments in EL (24.5%), and preparing and delivering presentations in EL (30.4%) (Table 3).

There were overwhelmingly positive attitudes and perceptions regarding EMI. A salient finding was that students predominantly attached great importance to EMI in scientific fields and recognized its advantages (Table 4). In addition, 91.2% strongly agreed that EMI would improve their EL skills, and 92.2% were strongly in favor of implementing EMI. Furthermore, 87.3% considered EMI important for their career prospects, believing it provided more benefits than disadvantages (Table 5). However, although the results showed an overall tendency towards a willingness to consider henceforth EL as the language of higher education, 72.5% of participants expressed a desire to maintain both FL and EL in their faculty.

To determine the association between several explanatory variables and the students' choice of EMI, we conducted a bivariate analysis. The variable representing the EMI choice to be explained was "If an EMI course is offered in my faculty, I will definitely go for it." The selected explanatory variables that we crossed with were: age, gender, course year, EL certification and the variables "I like learning EL", "EL is useful for the medical field", and "EL should be the language of higher education. Both Fisher's test and the Chi-square test were performed, depending on the sample size.

The contingency table revealed a statistically significant association between "EMI choice" and the following explanatory variables: age ($p = 0.035$), course year ($p < 0.001$), "I like learning English" ($p = 0.011$), and "EL should be the language of higher education" ($p < 0.001$). There was a growing tendency for EMI choice as age increased and according to the course year, with the highest percentage recorded between the 3rd and 4th years at 96.4%. In terms of gender, there was a difference between males (78.4%) and females (67.7%). The highest percentages were observed among students in favor of EMI who like learning EL (75.8%), those who believe that EL is useful for the medical field (72.9%), and those who estimate that EL should be the language of higher education (80.5%). Although the variable "EL is useful for medical field did not reach statistical significance,

they were 96.1% to agree with and 72.9% among them who chose EMI choice. The lack of statistical significance could be attributed to a strong homogeneity of responses, which reduces variance. Given the low expected cell counts, we used Fisher test and calculated Cramer's coefficient, which revealed a moderate association (Cramer's coefficient = 0.207), suggesting a practical importance of EMI in medical studies. The contingency tables are summarized inTable6.

Furthermore, we conducted a univariate regression which revealed three influencing factors: Course year 4-3 (OR = 23.14, 95%CI [2.85 - 187.6], p = 0.003), "I like learning EL (OR = 5.48, 95% CI [1.46 - 20.52, p = 0.011], and "EL should be the language of higher education" (OR =7.66, 95% CI 2.63 - 22.31, p <0.001). Then, we performed a descending multivariate regression, ensuring to keep the most relevant predictors in the model, based on their statistical significance or their importance (Gender, and "EL is useful for medical studies) (Table 7). The results showed that the variables "4 - 3 course year" (OR = 8.83, 95% CI [2.05–172.69], p = 0.009), "I like learning EL" (OR = 6.90, 95% CI [1.31–36.16], p = 0.022) and "EL should be the language of higher education" (OR = 6.38, 95% CI [1.87–21.72], p =0.003) have a positive and statistically significant influence on the EMI choice. Moreover, we included two additional variables which are gender and "EL is useful for medical field" in the model based on their contextual relevance. They did not reach statistical significance.

Discussion

This study revealed a general positive attitude of medical students of the FMPR towards the implementation of EMI. The following high percentages of participants support this key finding: 96.1% of participants considered that "EL is useful for the medical field", 98% recognized the multilingualism's advantages, 83.2% were interested by international mobility, such as to study or to work abroad, and 80.4% shed lights on the advantage "to have better professional opportunities". Furthermore, 69.6% were interested by the improvement of learning medical content subjects in EL, and 65.7% by the enhancement of EL skills. The latter undoubtedly adds a new dimension to a resume, aligning with the broader benefits of publishing in EL medical journals to reach a wider audience.

In the medical field, several arguments support the implementation of EMI programs. One of the strongest arguments is that international communication in the medical field mainly occurs in EL. As the majority of medical literature is published in EL, EMI enables medical students to access the latest studies, stay updated with recent medical practices, and effectively communicate and collaborate with the global medical community. This is particularly beneficial during international conferences which are pivotal for professional growth [16]. The bivariate analysis of the study revealed that 72.9% of students who favored EMI choice considered that "EL is useful for the medical field". As students advance in their studies, they are increasingly likely to choose an EMI curriculum. In their third year, 53.8% supported the EMI choice, while 46.2% were against, showing roughly similar percentages. In contrast, by their fourth year, an overwhelming 96.4%

favored the EMI choice ($p < 0.001$). These results demonstrated a statistically significant association between advanced years of study at the FMPR and the EMI choice. This finding correlates with the first argument, as students are more inclined to publish in their advanced years of study. Other significant statistical associations were identified between the EMI choice and the variables "to like learning EL" (75.8%, $p<0.011$), and "EL should be the medium of higher education" (80.5%, $p < 0.001$). Nguyen pointed out that an EMI curriculum facilitates the easy acquisition of medical terminology, an indispensable prerequisite for participating in international conferences and sharing experiences and research findings [17]. Almudibry reported the same favorable student attitudes toward using EMI in scientific disciplines among a sample of 85 participants, 21% of whom were from a medical college, the majority expressed a strong willingness to study using EMI [18].

A students' positive attitude towards EMI implementation in public educational institutions is essential for its acceptance and success. This study highlighted the particularity of EMI programs in public faculties, where attendees come from diverse social backgrounds, and may not have had equal educational opportunities. Roshini noted that linguistic background plays a key role in academic performance [19].

After Brexit, the agreement between Morocco and the United Kingdom, signed on 26 October 2019, entered into force on 1 January 2021. In the educational field, one of the major Moroccan goals of this British partnership is to enhance its attractiveness for researchers and PhD students in the UK[20]. To align with this broader goal, some Moroccan private universities, such as Mohammed VI Polytechnic University in Benguerir (UM6P) [21] and University Mohammed VI of Health Sciences (UM6SS), introduced EMI medical programs [22]. However, the use of EMI in private universities may exacerbate social inequalities by creating unequal access to EMI classes and potentially unfair promotion opportunities. To address these concerns, the two countries signed in 2023 a Memorandum of Understanding (MoU) aiming to increase the integration of EL assessments in Moroccan public universities [23].

The introduction of EMI in Moroccan universities has been well come by students, among a young population who is strongly in favor of EL[24]. For Moroccan youth, EL is the language of social networks, movies and music. In this study, 86.3% of participants declared that they often listen to music in EL, while 87.3% indicated that they often watch English-speaking films. This everyday exposure facilitates the development of listening and speaking skills within higher education curricula, serving as a foundation for further improvement in other academic EL skills. Positive perceptions and attitudes towards EL among medical students correlate with this daily use. The results of this study support this assertion: 83.3% of participants reported that they "like to use EL", while 89.2% expressed that they "like to learn EL". A similar enthusiasm has been documented by Belhiah in his series of 286 students from five universities who expressed a passion for EL that they consider worth studying [25].

In reality, the reasons behind Moroccan youth's penchant with EL is more complex than it may initially appear. While the motivations for adopting EMI are largely similar across different countries, such as enhancing

educational quality, improving access to global communication and employability, and fostering cultural exchange, geopolitical factors may shape the priorities of specific nations. For instance, North African countries with a shared history of French colonialism demonstrate a strong political commitment to accessing global opportunities through EL instruction [5]. This commitment has significantly influenced their decision to revise language policies within their educational systems, previously dominated by FL [5].

In Morocco, mastering FL, the former colonizer's language, has long been a marker of elite status, signifying education in prestigious institutions that condition access on this prerequisite. The upper classes reinforce their social dominance by using this language associated with prestige in daily life, many having attended costly private French schools. During the era of Arabization in Moroccan education policy, an anti-French sentiment likely emerged. Some might think that this feeling would be rooted in the frustration over not meeting the language prerequisite for access to elite institutions and careers. This sentiment also stemmed from the association of French-speaking Moroccans with colonial heritage and schools holding colonizers' names. However, this discontent would have developed against the backdrop of colonial legacies rather than being related to FL itself. From this perspective, EL is likely to be universally accepted by Moroccan youth, who are increasingly accustomed to using, in their daily lives, a language undeniably attractive because enjoying the advantage for not being associated with colonialism. This finding is particularly relevant to the participants of this study, as 88.2% agreed with the statement that "EL should be the language of higher education".

A survey conducted by British Council in 2021 confirmed this Moroccan youth's growing propensity for EL, revealing that 40% of young Moroccans consider EL the most important language to learn [26]. The same interest has been shown by 82.4% of participants who declared to choose an EMI program if offered at the FMPR. However, it is important to mention that a significant proportion (72.5%) of participants considered that both FL and EL should be kept as mediums of instruction in higher education.

However, linguistic concerns may arise among medical students, particularly regarding the cognitive load associated with the dual challenge of mastering medical content while improving EL proficiency. 36.3% of participants considered that "the content subjects are more difficult to learn in EL", thus expressing their fear about the potential impact on their academic performance. In addition, some cultural concerns were identified: 14.7% feared the "loss of mother tongue", while only 7.8% believed that EMI would lead to a loss of culture and 2.9 % expressed concern about a loss of identity. These relatively low percentages of cultural concerns may be attributed to the fact that the medium of higher education is already a non-native language, FL, which has historically not been perceived as having a negative cultural impact on Moroccan students' cultural identity.

Conclusion

This study revealed a general positive attitude among medical students of second level of the FMPR, a public faculty, towards implementing an EMI curriculum. It highlighted a majority of students holding a favorable perception of their EL proficiency, particularly in general and academic listening and reading skills. Support for EL increased in the fourth academic year, reflecting students' growing awareness of its crucial importance for international scientific visibility and medical studies, as well as in higher education in general. If the opportunities provided by this global language in terms of education and employability represent the main factors of its attractiveness, its status of daily life language of Moroccan youth through social media and internet, transcending social distinctions, and not being associated to a colonial legacy succeeded to unify Moroccan youth around the same language. This status not restricted to social elite and the international opportunities offered by this global language are significant factors influencing the EMI choice. The findings of this study may serve to inform medical institutions operating within comparable educational and cultural contexts where regional trends have been observed, as well as those in culturally diverse countries, all of which are progressively impacted by the globalization of EL.

Limitations and future research directions

The meaningful relationship between EMI choice and the variable "EL is useful for the medical field," as indicated by Cramer's coefficient is not strong enough and suggests the need for further exploration using qualitative methods before drawing any conclusions. Additionally, the questionnaire included an open-ended question in its final section, but none of the students responded to it. We believe that qualitative methods would be more suitable in future research after EMI implementation to report students' lived experiences and challenges, as well as their perceived impact of EMI on their performance. Furthermore, the in-depth insights provided by interviews could uncover issues that have not been addressed before EMI implementation, thereby enabling curriculum improvement.

While this study is focused on a specific region, elucidating regional trends contributes meaningfully to the advancement of knowledge within comparable educational and cultural contexts. Moreover, these findings have the potential to inform and inspire research in diverse settings, particularly given the pervasive global influence and integration of EL within medical education worldwide.

Ethics approval and consent to participate

Not applicable

According to Section 2 of the guidelines of the Comité d'Éthique pour la Recherche Biomédicale (CERB) of the Faculty of Medicine and Pharmacy of Rabat, the committee reviews only biomedical research involving human subjects, such as clinical trials or biomedical experiments. Preclinical and non-biomedical research, including studies without medical interventions or biomedical data collection, fall outside CERB's scope. Therefore, according to CERB policies and Moroccan regulations, this study did not require formal submission or approval by CERB.

Nevertheless, all ethical standards were upheld, including obtaining voluntary informed consent from participants and ensuring confidentiality and anonymity of the data. The study adhered to the core ethical principles of the Declaration of Helsinki. Participant anonymity, informed consent, and risk minimization were rigorously respected throughout the research.

Consent for publication

Appendices

Appendix A : Questionnaire

Dear participant,

This questionnaire is part of a research project on the use of the English language (EL) as a means of instruction in your faculty (EMI: English as a medium of instruction). Some questions are in the form of Likert scales while others have multiple choices, allowing you to check the answers that seem most appropriate to you. Your contribution is invaluable to the completion of this research project and is highly appreciated. Your anonymous answers will be held in strict confidentiality and will be used only for the purposes of this study. The results will be reported in aggregate form only, and cannot be identified individually. Thank you for your collaboration.

.   Years

2. Gender

□ Male   □ Female

3. Course year

□ 3rd year   □ 4th year   □ 5th year   □ 6th year   □ 7th year

II.   PROFICIENCY IN ENGLISH LANGUAGE

4. Do you speak EL?

□ Yes   □ No

5. At what grade level did you start learning EL?

....

6. Have you got a certified EL level?

□ Yes   □ N

7. If you checked Yes above, please check your certified level below.

□ A1   □ A2   □ B1   □ B2   □ C1   □ C2

8. General EL

Instructions: On a scale from 0 to 5, select your level of proficiency in EL in the following areas:

0…………………1………..……….2………..……..3…………..……….4…........................ 5

None   Basic   Average   Quite Good Good   Excellent

Speaking in regular everyday interactions	**0……..1……...2……...3……...4…....... 5**
Listening in regular daily interactions	0……...1……...2……...3……...4…....... 5
Reading about general topics of interest to me (Newspapers, magazines, books)	0……...1……...2……...3……...4…....... 5
Communicate in writing on social media platforms	0……...1……...2……...3……...4…....... 5

9. Academic EL

Instructions: On a scale from 0 to 5, select your level of proficiency in EL for academic studies in the field of medicine.

0…………………1………..……….2………..……….3 …………..…….. 4…........................ 5

None   Basic   Average   Quite Good Good   Excellent

Discuss technical ideas in the field of medicine.	**0……...1……...2……...3……...4…..... 5**
Prepare and deliver a presentation about a medical issue.	0……...1……...2……...3……...4…..... 5
Understand videos about medical issues	0……...1……...2……...3……...4…..... 5
Read medicine textbooks in EL	0……...1……...2……...3……...4…..... 5
Write class assignments in EL about topics in medicine	0……...1……...2……...3……...4…..... 5
Communicating in EL with my course instructors	0……...1……...2……...3……...4…..... 5
Write a scientific article for publication in a medical journal	0……...1……...2……...3……...4…..... 5

10. Exposure to EL

Instructions: Please, rate to what extent you are exposed to EL in the following contexts.

Interacting with friends	Never…rarely…sometimes…often…always
Watching movies	Never…rarely…sometimes…often…always
Listening to the radio/music	Never…rarely…sometimes…often…always
Listening to podcasts	Never…rarely…sometimes…often…always
Reading	Never…rarely…sometimes…often…always
Free writing	Never…rarely…sometimes…often…always
Private English classes	Never…rarely…sometimes…often…always

11. What strategies do you use to improve your EL skills?

□ Private language classes

□ Reading

□ Discussion

□ Watching   Movies

□ Listening to music

□ Using English online

□ Others (Please specify) …………………………………………….

III. LANGUAGE PERCEPTIONS AND ATTITUDES

12. **Instructions: Please use the scale below to rate the extent to which you agree/disagree with the following:**

1……….………..…..2……………..…..3 ………..…....…… 4…...................... 5

Strongly Disagree   Disagree   Neutral   Agree   Strongly Agree

I like learning EL	**1………....2……..…..3.…….…..4…** **5**
I like to use EL	1………....2……..…..3.…….…..4….......... 5
EL is very useful for work in Morocco	1………....2……..…..3.…….…..4….......... 5
EL is useful for medical scientific field	1………....2……..…..3.…….…..4….......... 5
EL should be the language of higher education	1………....2……..…..3.…….…..4….......... 5
We should have more courses using EMI in higher education	1………....2……..…..3.…….…..4….......... 5
If an EL program is offered in my faculty, I will definitely go for it.	1………....2……..…..3.…….…..4….......... 5
Multilingualism offers me advantages	1………....2……..…..3.…….…..4….......... 5
We should keep both French language and EL as mediums of instruction in higher education	1………....2……..…..3.…….…..4….......... 5

IV. NEEDS OF EMI

13. Instructions: Please use the scale below to rate the extent to which you agree/disagree with the following:

1……….………..…..2……………..…..3 ………..…......…. 4…........................5

Strongly Disagree   Disagree   Neutral   Agree   Strongly Agree

For medical studies using EMI, I need training in the following skills and areas:

Academic Speaking (e.g. Presentations)	1………....2……..…..3….…..…..4…...........5
Academic Listening (e.g. Lectures)	1………....2……..…..3….…..…..4….............5
Academic Reading (e.g. Textbooks)	1………....2……..…..3….…..…..4….............5
Academic Writing (e.g. Assignments)	1………....2……..…..3….…..…..4….............5
Academic Vocabulary	1…….…....2……..…..3….…..…..4….............5
Grammar	1………....2……..…..3….…..…..4….............5

14. What resources can support your medical studies using EMI?

Instructions: Please use the scale below to rate the extent to which you agree/disagree with the following:

1……….………..…..2……………..…..3 ………..…......…. 4…........................5

Strongly Disagree   Disagree   Neutral   Agree   Strongly Agree

Access to medical EL online courses	
Access to sites for medical students	1………....2……..…..3….…..…..4…... 5
Access to medical EL tutorials, with activities and exercises for doctors	1………....2……..…..3….…..…..4…... 5
Sites for general EL	
Sites for online grammar with exercises	1………....2……..…..3….…..…..4…... 5
Subscriptions in international professional associations	1………....2……..…..3….…..…..4…... 5

15. **What difficulties do you think you may encounter if EL is adopted as a medium of instruction at your faculty? (Please check all that apply).**

□ Understanding lectures

□ Understanding EL medical textbooks

□ Participating in class discussions

□ Writing assignments in EL

□ Preparing and delivering presentations in EL

□ Others (Please specify)

16. **Have you received any training in studying using EMI? If yes, what type of training? (Please check all that apply)**

□ No, I haven't received any training

□ General EL courses

□ Academic EL courses

□ E-learning platform courses

□ Video-conferencing courses

□ Others (Please specify): ………………………………………..

17. **Do you think that EMI could help you improve your EL skills?**

□ Strongly disagree   □ Disagree   □ Neutral   □ Agree   □ Strongly agree

18. **How important is EMI to your career prospects?**

□ Unimportant   □ Slightly Important   □ Moderately Important   □ Important   □ Very Important

19. What do you see as the benefits of EMI?

□ To improve my level of EL skills (listening, speaking, oral interactions, presentations, debates, reading, writing)

□ To improve my learning of the medical content subjects

□ To have better professional opportunities

□ To have more opportunities regarding international mobility (study or work abroad)

□ Others (Please, specify) ………………………………………………….

20. In your opinion, what are the disadvantages EMI? (Please check all that apply)

□ Loss of mother tongue

□ Loss of local culture

□ Loss of identity

□ The content subjects are more difficult to learn in English

□ Other (Please specify): …………………………………………………

21. What do you think about the use of EMI in higher education in general?

□ Strongly disagree   □ Disagree   □ Neutral   □ Agree   □ Strongly agree

22. If I have the choice, I will opt for an EMI program

Instructions: Please use the scale below to rate the extent to which you agree/disagree with the following statements:

1……….…………..…2……………….……..3 ………..….....….. 4…........................5

Strongly Disagree   Disagree   Neutral   Agree   Strongly Agree

It is exclusively in EL	**1………....2……...…..3………….4…............5**
It offers a bilingual FL-EL training	1………....2……....…..3…………..4…............5
It offers regular classes in academic EL every year	1………....2……....…..3…………..4…............5
It offers regular classes in medical EL every year	1………....2……....…..3…………..4…............5
If there is a certified EL proficiency requirement for incoming students (IELTS, TOEFL).	1………....2……....…..3…………..4…............5
The lectures are in EL	1………....2……....…..3…………..4…............5
The examinations are in EL	1………....2……....…..3…………..4…............5
If translation of concepts and use of FL is tolerated in class	1………....2……....…..3…………..4…............5
Lectures discussions are exclusively in EL	1………....2……....…..3…………..4…............5

23. Do you have any other suggestions or comments regarding EMI?

……………………………………………………………………………………………………

……………………………………………………………………………………………………

Appendix B : Tables and figures

Table 1: Scores Alpha Cronbach of questionnaire dimensions

	Proficiency in EL	Language perceptions and attitudes	Needs of EMI
Alpha Cronbach	0,874	0,565	0,630

Figure1. Distribution of students by gender   Figure 2. Distribution of students by year of study

Table 2. Students with exposure to EL (n = 103)

	Rarely n (%)	Sometimes n (%)	Often n (%)
Interacting with friends	18 (17.6)	32 (31.4)	52 (51)
Watching movies	5 (4.9)	8 (7.8)	89 (87.3)
Listening to the radio/music	6 (5.9)	8 (7.8)	88 (86.3)
Listening to podcasts	10 (9.8)	25 (24.5)	67 (65.7)
Reading	13 (12.7)	40 (39.2)	49 (48)
Free writing	53 (52)	32 (31.4)	17 (16.7)
Private English classes	69 (67.6)	20 (19,6)	13 (12.7)

Table 3. Perceived students' skills in General and Academic EL (n = 103)

	Basic n(%)	Average n (%)	Good n (%)
General EL			
Speaking in regular everyday interactions	10 (9.8)	30 (29.4)	62 (60.8)
Listening in regular daily interactions	7 (6.9)	18 (17.6)	77 (75.5)
Reading about general topics of interest to me (Newspapers, magazines, books)	9 (8.8)	26 (25.5)	67 (65.7)
Communicate in writing on social media platforms	7 (6.9)	26 (25.5)	69 (67.6)
Academic EL			
Discuss technical ideas in the field of medicine	29 (28.4)	46 (45.1)	27 (26.5)
Prepare and deliver a presentation about a medical issue	31 (30.4)	47 (46.1)	24 (23.5)
Understand videos about medical issues	11 (10.8)	36 (35.3)	55 (53.9)
Read medicine textbooks written in EL	17 (16.7)	36 (35.3)	49 (48)
Write class assignments in EL about topics in medicine	25 (24.5)	50 (49)	27 (26.5)
Communicating in EL with my course instructors	30 (29.4)	45 (44.1)	27 (26.5)
Write a scientific article for publication in a medical journal	44 (43.1)	38 (37.3)	20 (19.6)

Table 4. Language perceptions and attitudes of students (n = 103)

	Agree n (%)	Neutral n (%)	Disagree n (%)
I like to learn EL	91 (89.2)	7 (6.9)	4 (3.9)
I like to use EL	85 (83.3)	15 (14.7)	2 (2)
EL is very useful for work in Morocco	66 (64.7)	35 (34.3)	1 (1)
EL is useful for medical scientific field	98 (96.1)	4 (3.9)	-
EL should be the language of higher education	90 (88.2)	11 (10.8)	1 (1)
We should have more courses using EMI in higher education	89 (87.3)	13 (12.7)	-
If an EMI program is offered in my faculty, I will definitely go for it.	84 (82.4)	18 (17.6)	-
Multilingualism offers me advantages	100 (98)	2 (2)	-
We should keep both FL and EL as medium of instruction in higher education	74 (72.5)	25 (24.5)	3 (2.9)

Table 5. Benefits and disadvantages of EMI according to students (n = 103)

	Yes n (%)	No n (%)
Advantages		
To improve my level of EL skills (listening, speaking, oral interactions, presentations, debates, reading, writing)	67 (65.7)	35 (34.3)
To improve my learning of the medical content subjects	71 (69.6)	31 (30.4)
To have better professional opportunities	82 (80.4)	20 (19.6)
To have more opportunities regarding international mobility (study or work abroad)	84 (83.2)	17 (16.8)
Disadvantages		
Loss of mother tongue	15 (14.7)	87 (85.3)
Loss of local culture	8 (7.8)	94 (92.2)
Loss of identity	3 (2.9)	99 (97.1)
The content subjects are more difficult to learn in EL	37 (36.3)	65 (63.7)

Table 6. Bivariate analysis between EMI choice and the explanatory variables (n = 103)

	EMI choice		
	Yes **n (%)**	**No** **n (%)**	**p-value**
Age (years)			0.035
18-20	14 (51.9)	13 (48.1)	
21-23	41 (74.5)	14 (25.5)	
24-26	15 (88.2)	2 (11.8)	
Above	3 (100.0)	-	
Gender			0.250
Male	29 (78.4)	8 (21.6)	
Female	44 (67.7)	21 (32.3)	
Course year			<0.001
3rd	21 (53.8)	18 (46.2)	
4th	27 (96.4)	1 (3.6)	
5th	14 (70.0)	6 (30)	
6th	11 (73.3)	4 (26.4)	
EL certification			0.275
Certified	23 (79.3)	6 (20.7)	
Non- certified	50 (68.5)	23 (31.5)	
I like learning EL			0.011
Yes	69 (75.8)	22 (24.2)	
No	4 (36.4)	7 (63.6)	
EL is useful for medical field			0.068
Yes	70 (72.9)	26 (27.1)	
No	3 (50.0)	3 (50.0)	
EL should be the language of higher education			<0.001
Yes	66 (80.5)	16 (19.5)	
No	7 (35)	13 (65)	

Table 7. Associated factors with EMI choice: Univariate and multivariate logistic regression models

Associated factors	Univariate model			Multivariate model		
	OR [CI 95%]		p -value	OR	CI 95%	p-value
Gender	0.578	0.22 - 1.48	0.253	0.31	0.08 - 1.10	0.071
Course year						
4 – 3	23.14	2.85 - 187.6	0.003	8.83	2.05 - 172.69	0.009
5 – 3	2.00	0.63 - 6.28	0.235	1.81	0.50 - 6.49	0.36
6 – 3	2.36	0.63 - 8.70	0.198	2.13	0.44 - 10.15	0.34
EL certification	1.76	0.63 - 4.92	0.278	1.72	0.49 - 6.02	0.395
I like learning EL	5.48	1.46 - 20.52	0.011	6.90	1.31 - 36.16	0.022
EL is useful for medical field	2.69	0.51 - 14.19	0.243	1.13	0.12 - 10.51	0.911
EL should be the language of higher education	7.66	2.63 - 22.31	<0.001	6.38	1.87 - 21.72	0.003
