Supplementary figure 1 – LDH assay

PBMCs from healthy donors were trained with RPMI, 4 dilutions (10x, 50x, 100x, 400x) of the quadrivalent inactivated influenza vaccine (Vaxigrip Tetra®) alone or in presence of BCG. LDH concentrations were measured in fresh 24 h supernatants and calculated to percentages of cytotoxicity in relation to lysed cells. No significant differences were found among the various conditions (Wilcoxon matched pairs signed rank-test, n = 3).
