

Supporting information

S1 Fig.

S2 Fig.

Model for females		If characteristic present, write 1 in the corresponding cell	Score
Age class (years)	>60		
]40-60]		
]30-40]		
]20-30]		
]10-20]		
	<=10		
Medical history	Hypertension (treated or not)		
Symptoms	Mucosal bleeding		
	Clinical liquid accumulation		
	Skin rash (except purpura)		
Last biological results	Platelets <30 G/L		
	ALT>10N		
Model for males			
Age class (years)	>60		0,04
]40-60]		
]30-40]		
]20-30]		
]10-20]		
	<=10		
Risky behavior	Alcohol abuse >3 units/day		
Symptoms	Mucosal bleeding		
Last biological results	Platelets <30 G/L		
	ALT>10N		

S3 Fig.

♀ 25 years, gynecological bleeding, deep thrombocytopenia and liver cytolysis >10N
=> hospital admission decision

Model for females		Enter 1, if the item is present			
Age class (years)	>60			Score	
	40-60				0,94
	30-40				
	20-30	1			
	<=20				
Medical past history	Hypertension (treated or not)			Interpretation = high probability to develop severe dengue => admission in the dengue unit +/- iCU	
Symptomes	Muquous bleeding	1			
	Clinical liquid accumulation				
	Skin rash (except purpura)				
Last biological results	platelets <30 G/L	1			
	ALAT>10N	1			

Decisional threshold ♀
≥ 0,36

♂ 50 years, repeted vomiting + dehydration => hospital admission décision

Model for males					
Age class (years)	>60			Score	
	40-60	1			0,23
	30-40				
	20-30				
	<=20				
Medical past history	Alcohol abuse >3 units/day			Interpretation = low probability to develop severe dengue => admission in a medical unit, possibility of accomodation in surgery or gynecology in case of hospital beds saturation	
Symptomes	Muquous bleeding				
	platelets <30 G/L	1			
Last biological results	ALAT>10N				

Decisional threshold ♂
≥ 0,34

S4 Fig.Females (n=66)

Classification of the patients \ Result of the model	Severe dengue	Non-severe dengue
Severe dengue	11	6
Non-severe dengue	4	45

Males (n=64)

Classification of the patients \ Result of the model	Severe dengue	Non-severe dengue
Severe dengue	16	13
Non-severe dengue	3	32
