

Epidemiological and clinical characteristics, and virologic features of COVID-19 patients in Kazakhstan: a nation-wide, retrospective, cohort study.

Sergey Yegorov, PhD^{1*^}, Maiya Goremykina, MD^{2^}, Raifa Ivanova, MD^{2^}, Sara V. Good³, PhD, Dmitriy Babenko, MD^{3^}, Alexandr Shevtsov, PhD⁴ on behalf of the COVID-19 Genomics Research Group#, Kelly S. MacDonald, MD^{5,6} and Yersin Zhunussov, MD⁷ on behalf of the Semey COVID-19 Epidemiology Research Group ‖.

SUPPLEMENTARY MATERIAL

Whole genome sequencing methods

Sample collection: Nasopharyngeal swabs were collected from 53 symptomatic patients during clinical assessment. Samples were transported at 4-8°C in transport medium (medium 199 with Hanks' salts (Sigma, M0393), 4 ml Gentamicin solution (Sigma, G 1397), 11 ml BSA, fraction V (Sigma, A-8412), 11 ml 1 M HEPES buffer solution (Sigma, 83264) and delivered to the laboratory within 8 hours of collection.

SARS-CoV-2 infection validation: A commercially available Real-Time Fluorescent RT-PCR kit (BGI, Shenzhen) was used to confirm SARS-CoV-2-positive samples. For the NGS sequencing, samples were selected up to the 24th PCR threshold cycle.

RNA extraction and amplification: Total RNA was isolated using the GeneJet Viral DNA and RNA Purification Kit (Thermo Scientific) and quantified by fluorometry. Reverse transcription was performed with three primer mixes (see Table in appendix p. 3) and SuperScript™ IV Reverse Transcriptase (Invitrogen™) in a 40 µL reaction mixture containing 1x SSIV Buffer, 0,5 mM each dNTP, 5 mM DTT, 100 nM each primer, 10 U/µL SuperScript® IV Reverse Transcriptase and 20 µL RNA. Incubated at 50 °C for 30 minutes. The viral genome was amplified in 30 fragments, 944 -1364 bp long and an overlap of at least 170 bp. (see Table, appendix p. 4). Primers were designed using the FastPCR software ¹ using the Wuhan-1 sequence (Genbank accession number NC_045512) as reference. Each fragment was amplified in a singleplex PCR reaction with a volume of 25 µl. The reaction mixture included: 1× Platinum™ II PCR Buffer, 0,2 mM each dNTP dNTP, 200 nM forward and reverse primer, 0.04 U/µL Platinum™ II Taq Hot-Start DNA Polymerase, 3 µL cDNA. PCR amplification program included: long-term denaturation at 94 °C for 2 minutes; 10 cycles: 94 °C - 15 seconds, 58 °C - 30 seconds, 68 °C - 45 seconds; 25 cycles: 94 °C - 15 seconds, 58 °C - 15 seconds, 68 °C - 45 seconds, final elongation 15 minutes at 68 °C.

Sequencing strategy: Four samples (NCB1-5, see appendix p. 5) were sequenced by the Sanger dideoxy sequencing approach. PCR products were purified with ExoSAP-IT™ (Applied Biosystems) and sequenced using the BigDye® Terminator v3.1 Cycle Sequencing Kit (Applied Biosystems) and primers used for PCR amplification. Separation was performed using a 3730xl DNA Analyzer (Applied Biosystems). Collection of sequences was carried out using the SeqScape Software v. 3.0 according to the Wuhan-1 reference.

The rest 49 samples were sequenced using next generation Illumina sequencing technology as follows. PCR products were mixed into one mixture, which was purified using 0.6 volume AMPure XP (Beckman Coulter) and used to prepare libraries using Nextera DNA Flex Library Prep Kit (Illumina, USA), according to the manufacturer's instructions. Sequencing was performed on a MiSeq sequencer (Illumina, USA) using the MiSeq Reagent Kit v3, 600 Cycles (Catalog # MS-102-3003).

Virus genome analysis and annotation: Raw data quality control was carried out using FastQC v0.11.7 ² MultiQC v1.8 ³. Raw data trimming was carried out using the Seqkit v1.3-r106 software ⁴. FASTQ sequences were aligned to the Wuhan-1 reference using the BWA v0.7.17-r1188 software ⁵. For multiple genome alignment, fasta text files were imported into Ugene (<http://ugene.net/>) and the Illumina BaseSpace DRAGEN Pathogen Detection software with the following parameters: somatic small variant base caller, k-mers generated from the Wuhan-1 reference, minimum depth=10, minimum allele frequency=0.5, virus detection threshold 5% of the genome at 5X coverage. Variants were identified and a consensus sequence was obtained using Samtools v1.10 ⁶ и Bcftools v1.10.2-54 ⁷.

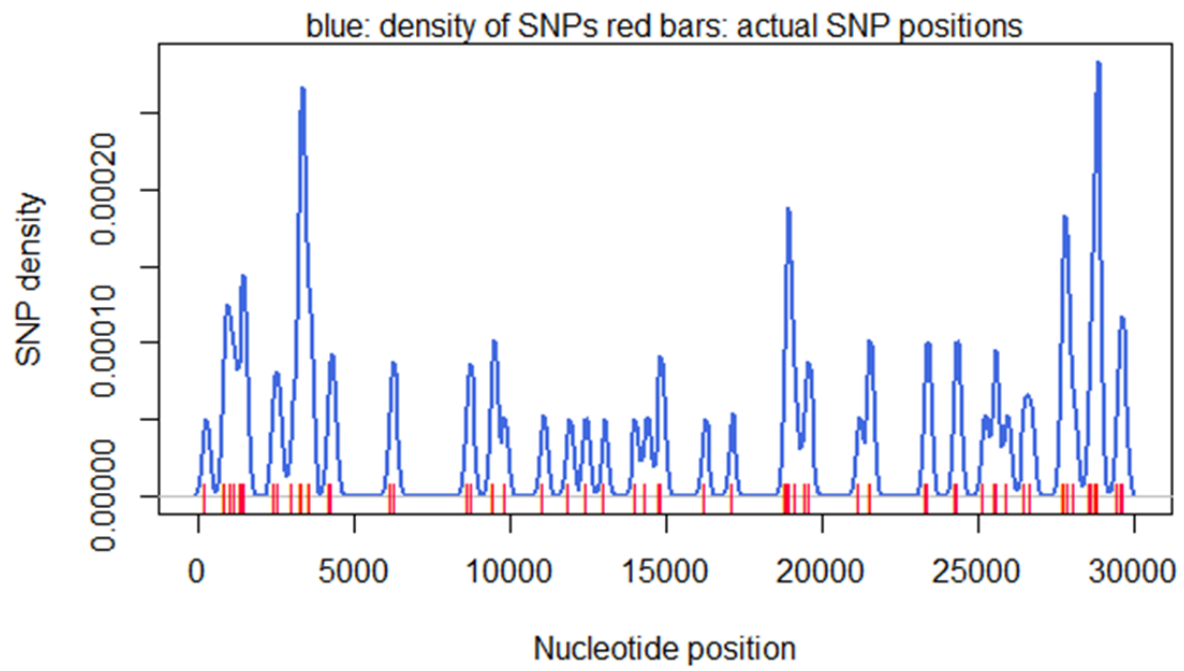

Primers used in RT-PCR

Primers#1		
	Primer name	Sequencing 5'-3'
	SARS-Cov2-RT-03	CAGTTGTGATGATTCCTAAGAAAACAA
