

Supplementary Material

SI Figure 1. Age distribution for each sample. Cam-CAN cohort N = 622, StrokeTOP cohort N = 790.

SI table 1. Overview of Quality Assurance (QA) metrics for DTI data

QA metric abbreviation	Measure
tsnr	Temporal-signal-to-noise-ratio
gmean	Global mean intensity
drift	Linear drift of signal over time
outmax	Outlier measurement maximum
outmean	Outlier measurement average
meanABSrmsb	Average absolute root-mean square
meanRELrmsb	Average relative root-mean square
maxABSrmsb	Maximum absolute root-mean square
maxRELrmsb	Maximum relative root-mean square

SI table 2. Overview of Cardiometabolic risk factors (CMRs) used.

Abbreviation used	Full description	Summary	Reference region (www.labhandbok.no)
BMI	Body mass index	Measure of body fat based on height and weight.	18.5 – 24.9
Smoking	Smoking	the action or habit of inhaling and exhaling the smoke of tobacco.	N/A
WHR	Waist-to-hip ratio	Dimensionless ratio of the circumference of the waist to that of the hips.	0.81-0.85 (women), 0.96-1.0 (men)
Systolic	Systolic	The blood pressure when the heart is contracting.	90-120
Diastolic	Diastolic	The pressure in the arteries when the heart rests between beats.	60-80
Pulse	Pulse	The heart rate - number of times the heart beats in one minute.	60-100
Haemoglobin	Haemoglobin	The iron-containing oxygen-transport metalloprotein in the red blood cells.	11,7 – 15,3 g/dL (women), 13,4 – 17,0 g/dL (men)
MVC	Mean corpuscular volume	Value that measures the average size and volume of a red blood cell.	82 – 98 fL
MCH	Mean corpuscular haemoglobin	The average quantity of haemoglobin present in a single red blood cell.	27 – 33 pg
MCHC	Mean corpuscular haemoglobin concentration	A measure of the average concentration of haemoglobin inside a single red blood cell.	32 – 35 g/dL
Thrombocytes	Thrombocytes /Platelets	component of blood whose function is to react to bleeding by clumping, thereby initiating a blood clot.	145 – 390 · 10^9/L
Sodium	Sodium	Sodium is an electrolyte that is key to helping send electrical signals between cells and controlling the amount of fluid in your body.	137 – 145 mmol/L
Potassium	Potassium	High levels are dangerous and could be sign of hypercalcemia. Kidney failure is the most common cause of high potassium.	3,6 -5,0 mmol/L
Chloride	Chloride	Chloride is a type of electrolyte. Electrolytes are electrically charged minerals that help control the amount of fluids and the balance of acids and bases in your body.	97 – 110 mmol/L
Calcium	Calcium	If there is too much or too little calcium in the blood, it may be a sign of bone disease, thyroid disease, kidney disease, or other medical conditions.	2,18 – 2,60 mmol/L
Magnesium	Magnesium	Magnesium deficiencies (hypomagnesemia) may be seen with malnutrition, conditions that cause malabsorption, and with excess loss of magnesium by the kidneys. Magnesium excess (hypermagnesemia) may be seen with the ingestion of antacids.	0,71 – 1,08 mmol/L
Phosphate	Phosphate	Normally, the kidneys filter and remove excess phosphate from the blood. If phosphate levels in your blood are too high or too low, it can be a sign of kidney disease or other serious disorder.	0,85 – 1,50 mmol/L (women), 0,75 – 1,65 mmol/L (men aged 18-49), 0,75 – 1,35 mmol/ (men aged 49+)
Creatinine	Creatinine	Normally, your kidneys filter creatinine from your blood and send it out of the body in your urine. If there is a problem with your	45 – 90 µmol/L (women), 60 – 105 µmol/L (men)

		kidneys, creatinine can build up in the blood and less will be released in urine.	
ALAT	Alanine transaminase	High levels of ALT in the blood can indicate a liver problem, even before you have signs of liver disease	≤ 45 U/L (women), ≤ 70 U/L (men)
CK	Creatine kinase	CK is a type of protein, known as an enzyme. A small amount of CK in the blood is normal. Higher amounts can mean a health problem.	35 – 210 U/L (women), 50 – 400 U/L (men aged 18-49), 40 – 280 U/L (men aged 49+) 105 – 205 U/L (aged 18-69), 115 – 255 U/L (69+)
LD	Lactate dehydrogenase	Higher than normal LD levels usually means you have some type of tissue damage or disease. Disorders that cause high LD levels include: Anemia, kidney disease, or liver disease.	105 – 205 U/L (aged 18-69), 115 – 255 U/L (69+)
GT	Gamma-glutamyl transferase	GGT is elevated in the blood in most diseases that cause damage to the liver or bile ducts.	≤ 45 U/L (women aged 18-39), ≤ 75 U/L (women aged 39+), ≤ 80 U/L (men aged 18-39), ≤ 115 U/L (men aged 39+) < 5 mg/L
CRP	C-reactive protein	CRP is a protein made by your liver. It's sent into your bloodstream in response to inflammation. High CRP is a marker of inflammation.	
Total cholesterol	Total cholesterol	a measure of the total amount of cholesterol in your blood. It includes both low-density lipoprotein (LDL) cholesterol and high-density lipoprotein (HDL) cholesterol.	Ages 18-29: 2,9 – 6,1 mmol/L, ages 30-49: 3,3 – 6,9 mmol/L, ages 49+: 3,9 – 7,8 mmol/L
HDL cholesterol	high-density lipoprotein cholesterol	known as the "good" cholesterol because it helps remove other forms of cholesterol from your bloodstream. Higher levels of HDL cholesterol are associated with a lower risk of heart disease.	1,0 – 2,7 mmol/L (women), 0,8 – 2,1 mmol/L (men)
LDL cholesterol	low-density lipoprotein cholesterol	often called the "bad" cholesterol because it collects in the walls of your blood vessels, raising your chances of health problems like a heart attack or stroke.	Ages 18-29: 1,2 – 4,3 mmol/L, ages 30-49: 1,4 – 4,7 mmol/L, ages 49+: 2,0 – 5,3 mmol/L
Triglycerides	Triglycerides	type of fat (lipid) found in your blood. When you eat, your body converts any calories it doesn't need to use right away into triglycerides.	0,45 – 2,60 mmol/L
Glucose	Glucose	Glucose is a type of sugar. A hormone called insulin helps move glucose from your bloodstream into your cells. High glucose may indicate diabetes.	4,0 – 6,0 mmol/L

SI Figure 2. Showing number of missing values for each of the cardiometabolic risk factors used in the study.

SI Figure 3. Showing percentage of missing data (left) and placement of missing data (right) for each cardiometabolic risk factor prior to imputation.

SI Figure 4. Showing density distribution of imputed cardiometabolic risk factors for five separate imputations. Blue lines represent original data, red lines represent imputed data.

SI Figure 5. Showing strip plot of imputed cardiometabolic risk factors for five separate imputations. Blue dots represent original data, red dots represent imputed data.

SI Figure 6. Showing the Mahalanobis distance plot, which measures the distance between a point and a distribution to which that point belongs.

SI Figure 7. Showing the quantile and adjusted quantile plot, which will solve for and order the squared Mahalanobis Distances for the given observations and plot them against the empirical Chi-Squared distribution function of these values. Every observation outside of the Chi-Square quantile is coloured in red.

SI Figure 8. Showing the manual removal of outliers using an interactive plot, whereby the adjusted quantile threshold is set by the user, ideally to when the data resembles normal distribution. Here, eight outliers are removed from the left-hand side plot, resulting in the right-hand side plot.

SI Figure 9. Age predictions before and after age-bias correction, where the plots on the left show the DTI and T1-weighted age predictions in the test sample. The red lines indicate the model fits in the Cam-CAN training sample, with overestimated predictions for younger participants and underestimated predictions for older participants. The plots on the right show the predictions after correcting for age-bias using the derived values of α and β from the fit described in section 2.9 ($Y = \alpha \times \Omega + \beta$) with $\text{Corrected Predicted Age} = \text{Predicted Age} + [\Omega - (\alpha \times \Omega + \beta)]$.

SI Figure 10. Posterior distributions of time on DTI and T1 BAGs. Shaded area represents 95% credible interval and vertical blue lines represent the mean of the posterior distribution.

SI Table 3. Showing Bayes factor (BF) interpretation.

Bayes factor BF_{12}			Interpretation
	>	100	Extreme evidence for M_1
30	-	100	Very Strong evidence for M_1
10	-	30	Strong evidence for M_1
3	-	10	Moderate evidence for M_1
1	-	3	Anecdotal evidence for M_1
	1		No evidence
1/3	-	1	Anecdotal evidence for M_2
1/10	-	1/3	Moderate evidence for M_2
1/30	-	1/10	Strong evidence for M_2
1/100	-	1/30	Very Strong evidence for M_2
	<	1/100	Extreme evidence for M_2

SI Table 4. Associations between cardiometabolic risk factors and time and age. CMR ~ Time + Sex + Age, and CMR ~ Age + Sex + Time (models = main effect).
