

Supplementary Figure 1. Titration of the anti-His antibody binding to individual viral antigen-coated beads. **A. Estimation of the antibody-binding capacity of MPro beads.** Magnetic beads coated with SARS-CoV-2 MPro were incubated with the indicated amounts of anti-his-tag antibody, followed by anti-rabbit-PE and analysed by flow cytometry. The histogram shows the fluorescence intensity for each anti-His concentration. **B. Estimation of the antibody-binding capacity of SARS-CoV-2 antigen-coated beads.** The same was done in parallel with different magnetic beads, each one coated with one SARS-CoV-2 antigen: Spike, the Receptor Binding Domain (RBD) of the S, the nucleocapsid protein (NP) and 3CL main protease (Mpro). Three dilutions of anti-His antibody were used: 16 ng/ml, 80 ng/ml and 400 ng/ml. The plots represent the MFI values obtained for each condition tested.

Multiantigen assay for SARS-CoV-2 antibody detection. Four different SARS-CoV-2 His-tagged antigens (Mpro, NP, S and RBD) were covalently coupled to magnetic beads labeled with dyes showing different fluorescence intensity in the APC and PerCP channels. Equal amounts of the different bead populations were mixed in the same tube and incubated with dilutions of plasma from patients or healthy donors, as indicated. Antibodies bound to the antigen were developed with fluorophore-conjugated anti-human Ig (FITC, PE and PE-Cyanine7) and samples were analysed by flow cytometry. Statistic comparison was carried out using a Mann-Whitney test.

A. IgG

B. IgA**C. IgM**

Multiantigen assay for SARS-CoV-2 shows no cross-reactivity with other respiratory diseases. Four different SARS-CoV-2 His-tagged antigens (Mpro, NP, S and RBD) were covalently coupled to magnetic beads labeled with dyes showing different fluorescence intensity in the APC and PerCP channels. Equal amounts of the different bead populations were mixed in the same tube and incubated with dilutions of plasma from patients or healthy donors, as indicated. Antibodies bound to the antigen were developed with fluorophore-conjugated anti-human Ig (FITC, PE and PE-Cyanine7) and samples were analysed by flow cytometry. **A. IgG. B. IgA. C. IgM**

Supplementary Table 1. Patient demographic and clinical data for severity study

		N=29	%
Gender	Male	25	86
	Female	4	14
Age	40-60	19	66
	61-70	5	17
	> 71	5	17
Time from symptoms onset to sample collection	< 15 days	3	10
	15-30 days	8	28
	31-45 days	4	14
	> 45	9	48
Hospitalization	Yes ICU	15	55
	No	14	45
Fever		16	55
Rhinorrhea		1	3
Anosmia		4	14
Ageusia		3	10
Odynophagia		2	7
Dry cough		11	38
Productive cough		3	10
Dyspnea		11	38
Pneumonia		13	45
Fatigue, myalgia, anorexia		14	48
Pulmonary infiltrate		13	45
Gastrointestinal symptoms		0	0
Cutaneous lesions		0	0
Multiorgan dysfunction		5	17
Thrombotic events		2	7
Comorbidities (HTN, DM, COPD, obesity, cancer)		7	24
Required mechanical ventilation		13	45
Death		2	7

ICU (intensive care unit), HTN (hypertension), DM (diabetes mellitus), COPD (chronic obstructive pulmonary disease).

Supplementary Table 2. Patient demographic for vaccination study

		N=15	%
Gender	Male	5	33.3
	Female	10	66.6
Age (25-56)	25-35	4	26.6
	36-45	4	26.6
	> 46	7	46.6
Days from first dose (2-35)	2 days	1	6.6
	10-20 days	5	33.3
	21-30 days	6	40.0
	> 31	3	20.0
Patients having received 2 nd dose	Y	9	60.0
	N	6	40.0

*Samples were stratified and randomly spliced into training and test sets. The training samples were used to fit a random forest classifier which then predicted the healthy vs disease category of unseen test samples (1/7 of total samples). This was repeated n=10,000 times. For each patient, accuracy was calculated as the proportion of correct predictions divided by the number of predictions made
