Supplementary Table S2: Number of mutations that were considered at which theoretical and median coverage. If N=7, it indicates that only the group of mutations with an initial coverage of approximately 10,000X was considered. If N=17, only the group of mutations with an initial coverage of approximately 5000X was considered. If N=24, it means that at that coverage all mutations could be considered.

Number of mutations	Theoretical coverage	Median coverage
N=7	10,000	9792
N=7	9000	8790
N=7	8000	7801
N=7	7000	6834
N=7	6000	5855
N=24	5000	4855
N=17	4500	4362
N=24	4000	3876
N=17	3500	3386
N=24	3000	2907
N=17	2500	2416
N=24	2000	1939.5
N=24	1500	1456
N=24	1000	971
N=17	750	730
N=24	500	483
N=17	250	239
N=7	200	201
N=17	100	98

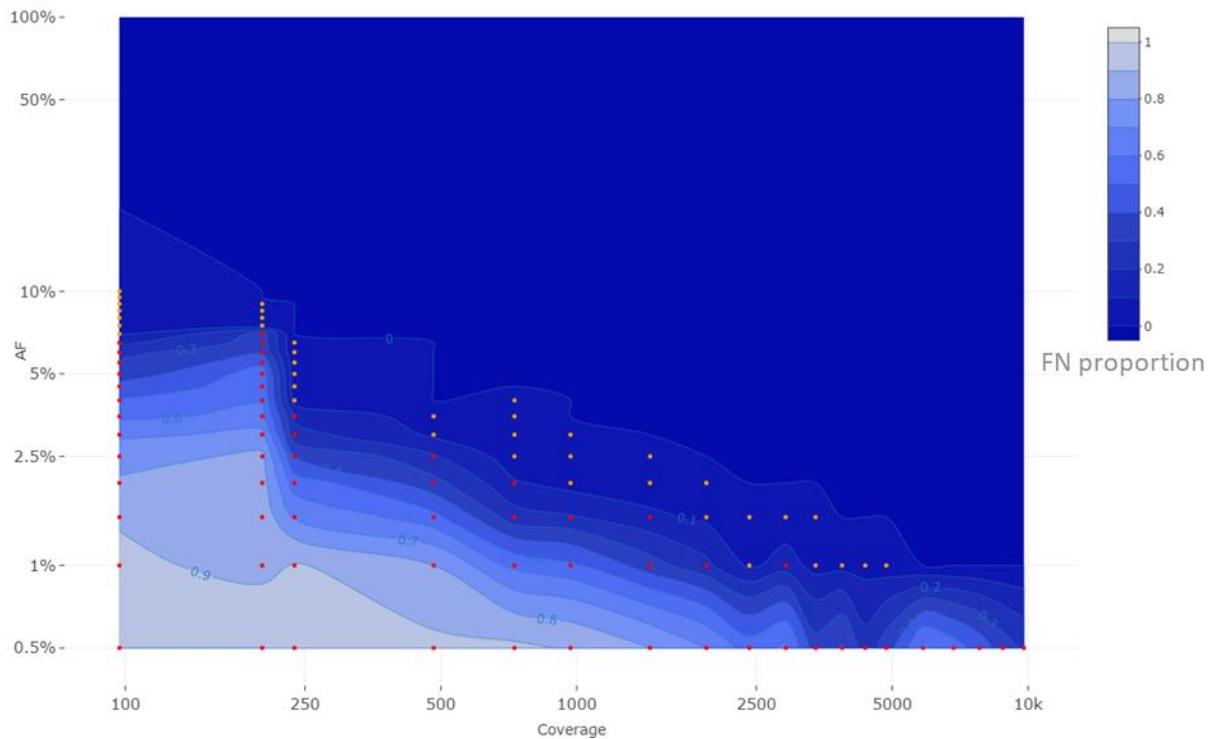

Supplementary Figure S1: Qualitative evaluation of Dataset 1 using the number of false negatives divided by the number of observations per condition until a targeted mutant AF of 100%. Orange and red dots represent conditions with a FN proportion between 0 and 0.1, and between 0.1 and 1, respectively. The percentage of false negatives is coloured ranging from 0 (dark) to 1 (yellow) in intervals of 0.1 as extrapolated using a contour plot in the R package `plotly` [61] (actual FN proportions are presented in Supplementary Table S3). Note that a targeted AF of 0% corresponds to the wild-type and is therefore not presented. Both the x- and y-axis follow a logarithmic scale.

Supplementary Table S3: Qualitative evaluation of Dataset 1 using the number of false negatives divided by the number of observations per condition until a targeted mutant AF of 100%. The percentage of false negatives is coloured ranging from 0 (dark) to 1 (light) according to the gradient depicted in

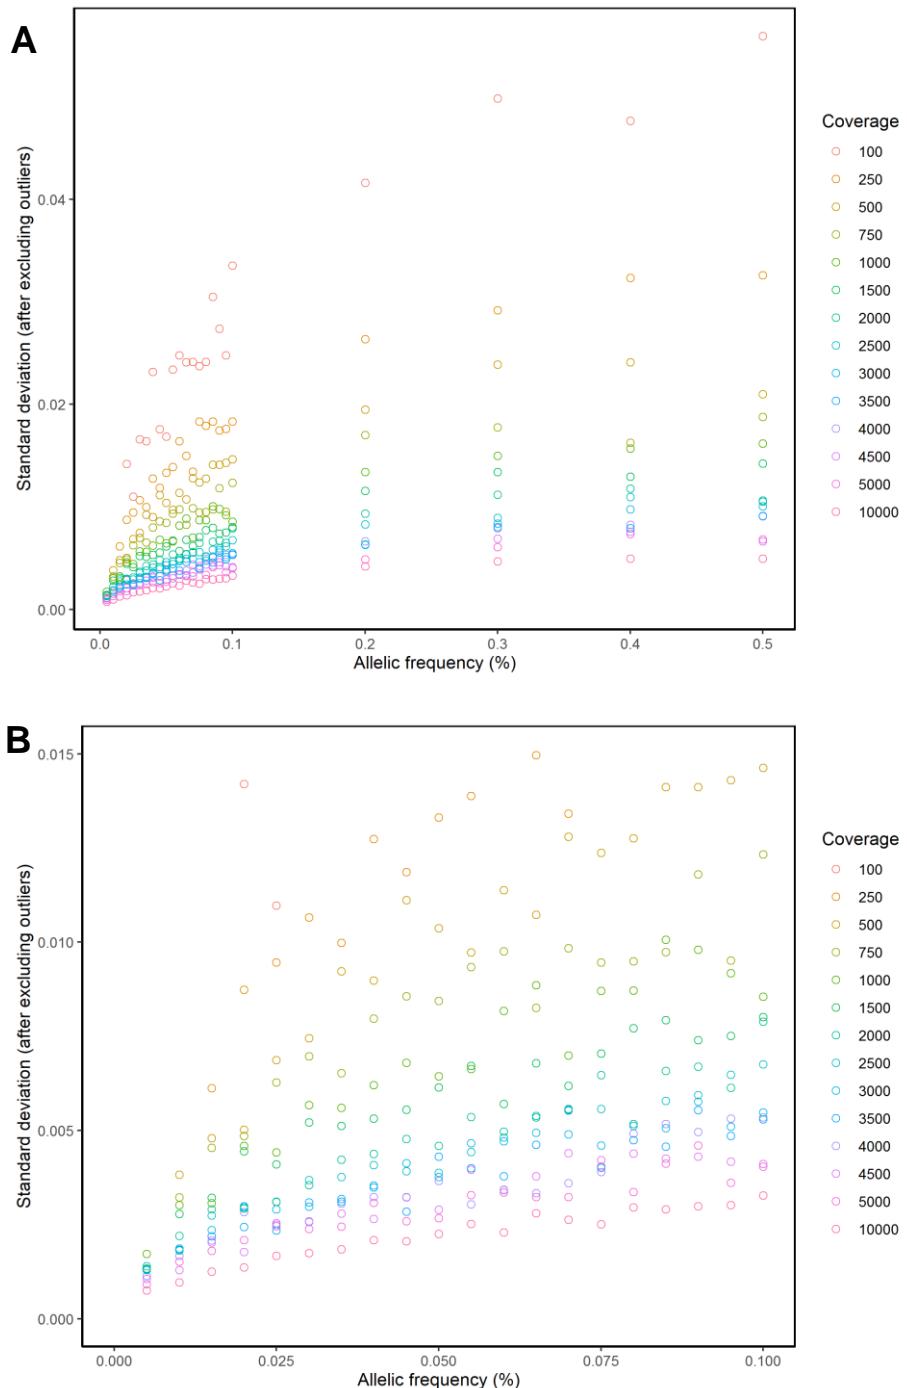

Supplementary Figure S1. Actual FN proportions are presented in Table 3. Note that a targeted AF of 0% corresponds to the wild-type and it is therefore not presented.

Supplementary Figure S2: Qualitative evaluation of Dataset 2 using the number of false negatives divided by the number of observations per condition until a targeted mutant AF of 100%. Orange and red dots represent conditions with a FN proportion between 0 and 0.1, and between 0.1 and 1, respectively. The percentage of false negatives is coloured ranging from 0 (dark) to 1 (light) in intervals of 0.1 as extrapolated using a contour plot in the R package `plotly` [61] (actual FN proportions are presented in Supplementary Table S4). Note that a targeted AF of 0% represents to the wild-type and is therefore not presented. Both the x- and y-axis follow a logarithmic scale.

Supplementary Table S4: Qualitative evaluation of Dataset 2 using the number of false negatives divided by the number of observations per condition until a targeted mutant AF of 100%. The percentage of false negatives is coloured ranging from 0 (dark) to 1 (light) according to the gradient depicted in Supplementary Figure S2. Actual FN proportions are presented in Table 3. Note that a targeted AF of 0% corresponds to the wild-type and it is therefore not presented.

Supplementary File S3: Variation of Dataset 1. In the plots of A and B the SD on the y-axis is plotted against the AF (Reference value) on the x-axis (A: range 0-50%; B: range 0-10%) for each coverage (colours). Table C includes the actual values for the performance metric that was visualized in Figure 3A. In table D the interquartile ranges for each condition is indicated. In the tables, conditions with a false negative percentage greater than 75% were excluded. Note that a targeted AF of 0% and 100% corresponds to the wild-type and mutant respectively and is therefore not presented.

Supplementary File S4: Variation of Dataset 2. In the plots of A and B the SD on the y-axis is plotted against the AF on the x-axis (A: range 0-50%; B: range 0-10%) for each coverage (colours). Table C includes the actual values for the performance metric that was visualized in Figure 3B. In table D the interquartile ranges for each condition is indicated, while excluding false negative results. In the tables, conditions with a false negative percentage greater than 75% were excluded. Note that a targeted AF of 0% and 100% corresponds to the wild-type and mutant respectively and is therefore not presented.
