

Supplementary Figures and Supplementary Figure Legends

Supplementary Fig 1. Correlation of anti-spike and anti-RBD antibodies in the saliva and serum after two-doses of mRNA vaccine

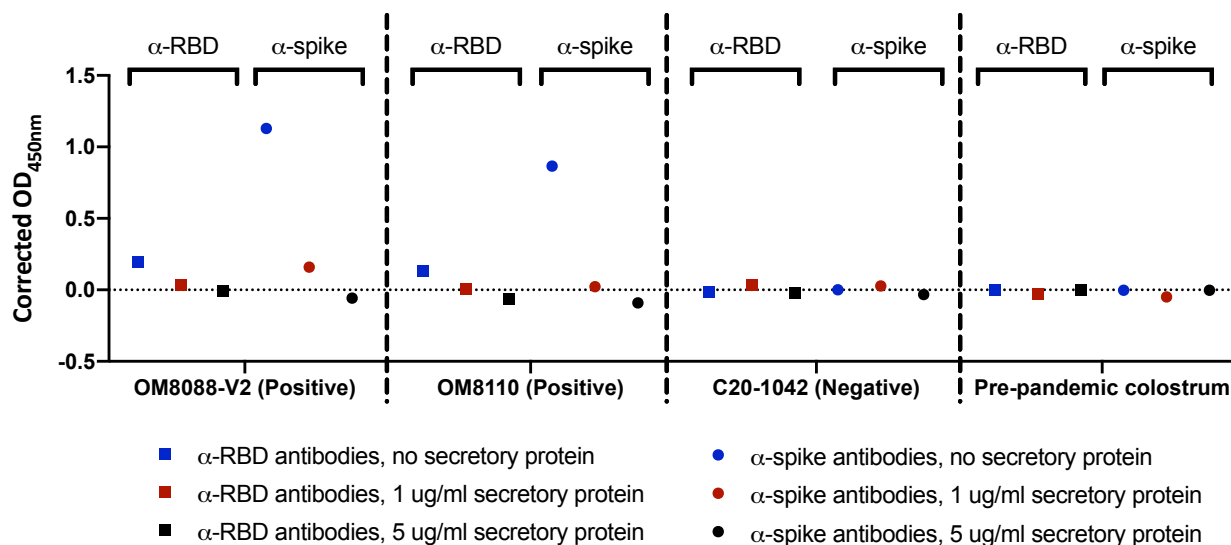

(A-D) N=128 Subjects were sampled 2-4 weeks after their second dose of either BNT162b2 or mRNA-1273. The indicated antibody isotypes (IgA and IgG) were analyzed in serum and saliva via an ELISA-based method. A Spearman test was used to calculate the correlation coefficient for each plot. We observed significant positive correlations for anti-RBD IgG (B), anti-Spike IgA (C) and anti-RBD IgA (D) in saliva and serum. We did not observe a significant correlation for anti-Spike IgG antibodies (A); however, this was due to oversaturation of signal in the serum. We therefore repeated the analysis for anti-Spike IgG using a lower concentration on a subset (n=39) of samples (E) using the 3rd point on the titration curve (F) and observed a significant positive correlation between serum and saliva titers. ns= not significant, **=p<0.01, ***=p<0.001 and ****=p<0.0001.

Supplementary Fig 2. Correlation of anti-spike and anti-RBD antibodies in the saliva and serum after a single dose of mRNA vaccine in the MSB-1 cohort.

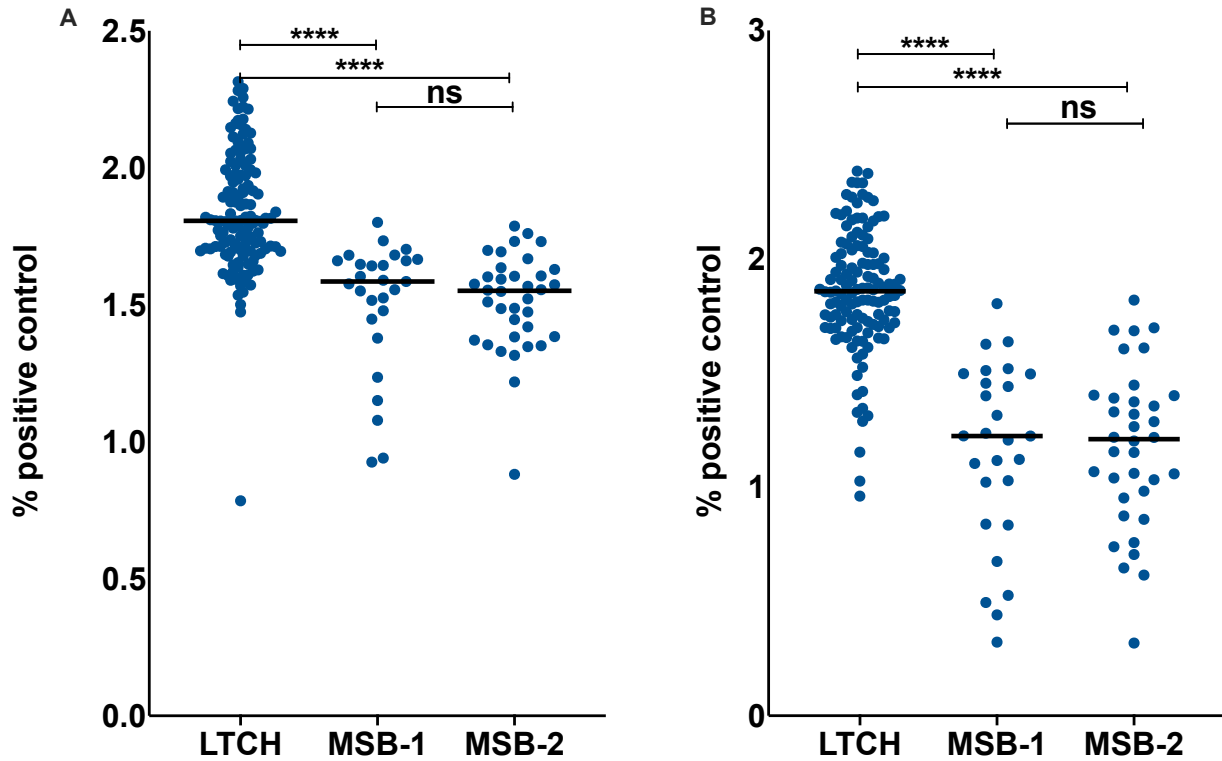

(A-D) N=27 MSB-1 participants were sampled 2-4 weeks after 1 dose with BNT162b2. The indicated antibody isotypes (IgA and IgG) were analyzed in serum and saliva via an ELISA-based method. Spearman test was used to calculate the correlation coefficient for each plot. ns= not significant, $*$ = $p<0.05$ and $***$ = $p<0.001$.

**Effect of incubating recombinant secretory protein
with α -secretory antibody prior to use in secretory component ELISA**

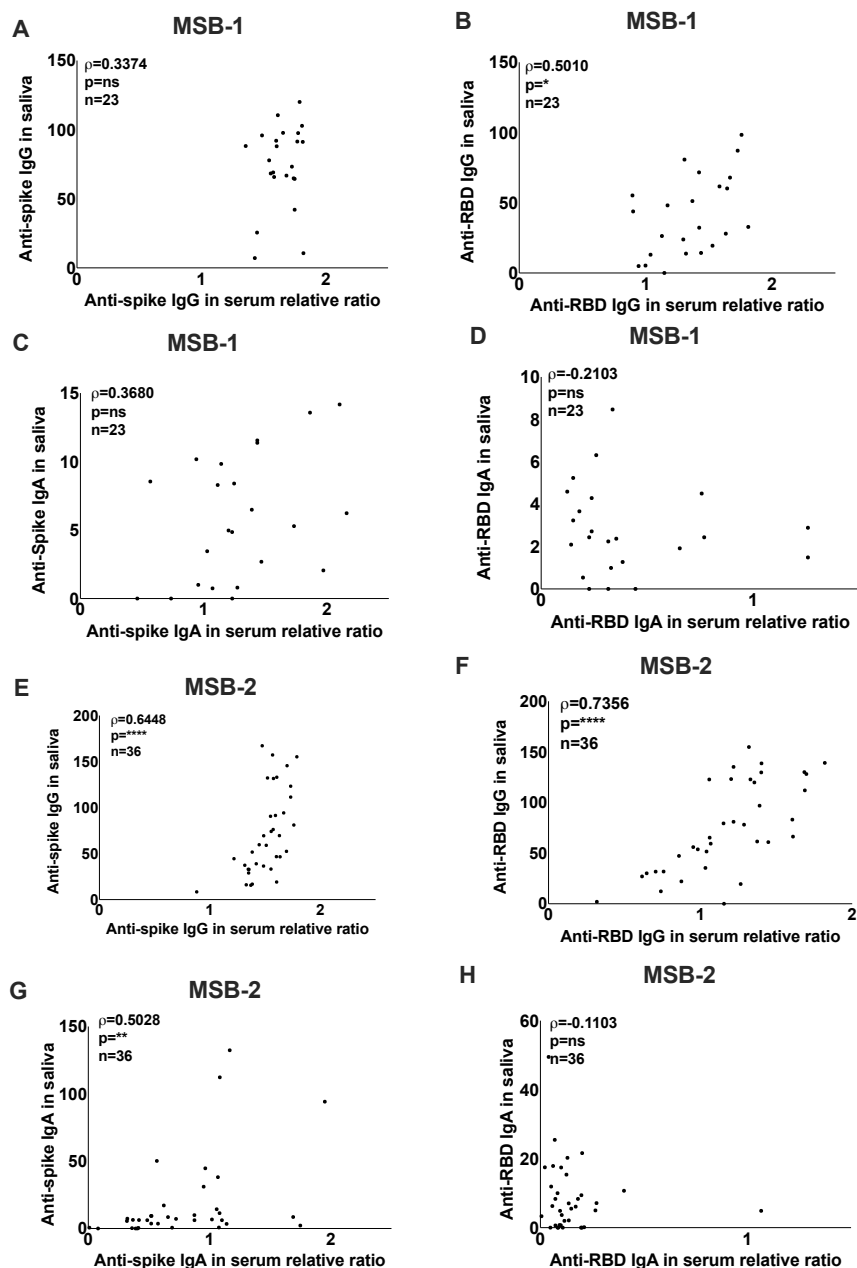

Supplementary Figure 3. Secretory component detected in antigen-specific antibodies from COVID-19 patient saliva

Validation of secretory component assay was confirmed by outcompeting signal with recombinant secretory component. We observed that incubation of COVID-19 positive samples with recombinant secretory component prior to incubation in the experimental plate brought signal down to negative control levels in a concentration-dependent manner. Pre-pandemic colostrum showed no evidence of anti-Spike/RBD associated secretory component signal, as expected. Mann-Whitney U test was used to calculate significance between groups, where ****= $p < 0.0001$.

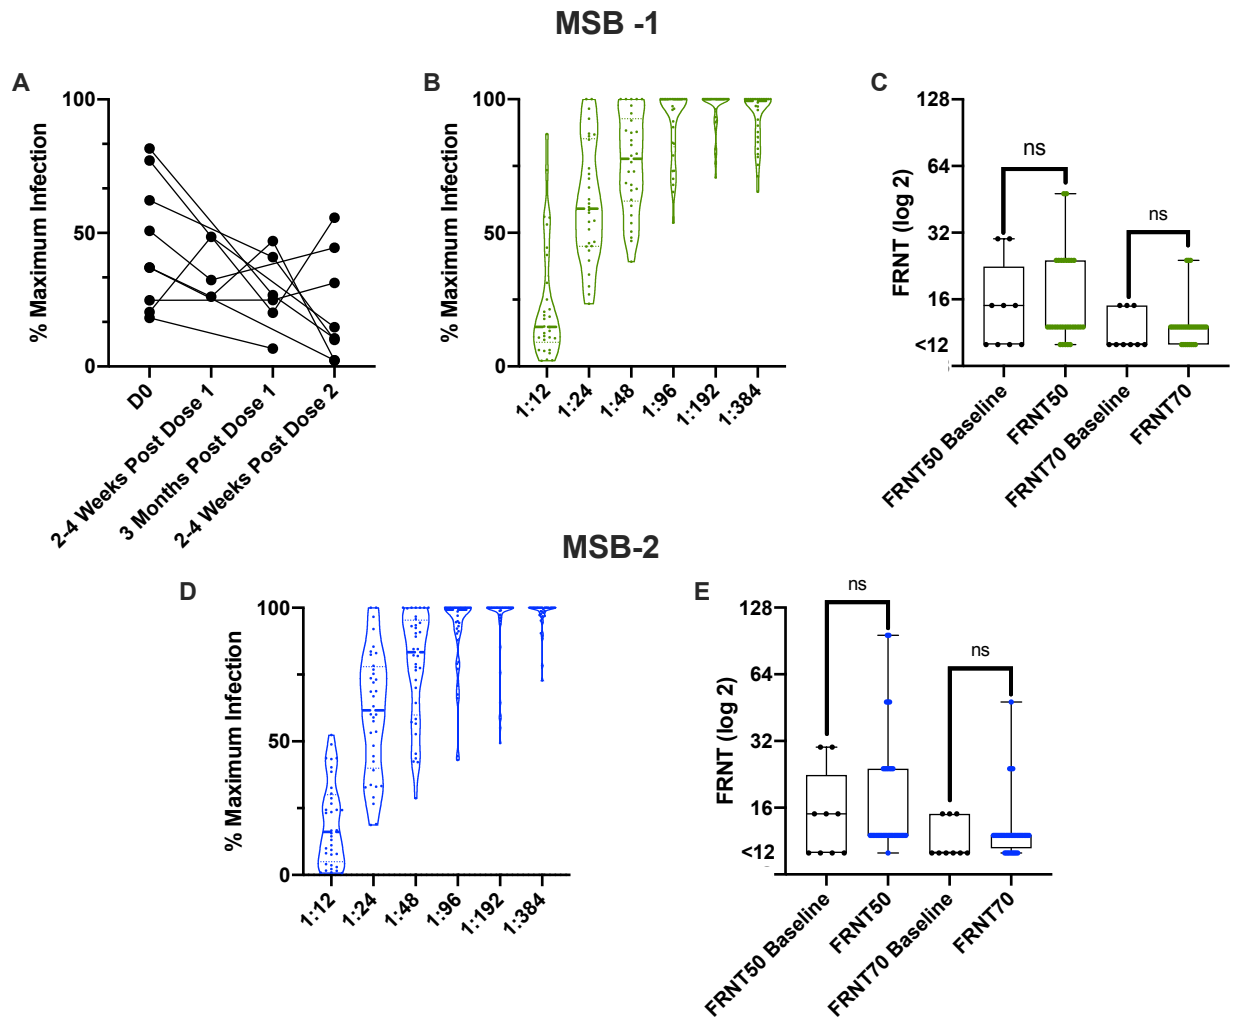

Supplementary Figure 4. Comparison of anti-Spike/RBD IgG levels in the serum in the LTCH, MSB-1 and MSB-2 cohorts.

(A, B) Subjects who received 2 doses of mRNA vaccines (LTCH, MSB-1) or 1 dose of ChAdOx1-S followed by a second dose of either BNT162b2 or mRNA1273 were sampled 2-4 weeks post-dose 2. Anti-spike and anti-RBD antibody levels were analyzed in serum via an ELISA-based method. We observed that subjects who received 2 doses of mRNA vaccines with doses 1 and 2 21-28 days apart (LTCH, n=93) had significantly higher levels of serum titres compared to subjects who received 2 doses of mRNA vaccines but doses 1 and 2 were 3 months apart (MSB-1, n=27). However, when comparing mRNA/mRNA (MSB-1) to Ad/mRNA (MSB-2, n=36) when both groups received delayed second doses, the difference in serum antibody titres was not significant. Spearman test was used to calculate the correlation coefficient for each plot, where ****= $p < 0.0001$.

Supplementary Figure 5. Correlation of anti-spike and anti-RBD antibodies in the saliva and serum after 2 vaccine doses

Participants from either MSB-1 or MSB-2 cohorts were sampled 2-4 weeks after 2 doses of BNT162b2 (MSB-1) or 1 dose of ChAdOx1-S and a second dose of either BNT162b2 or mRNA1273 (MSB-2). IgA and IgG were analyzed in serum and saliva, and a Spearman test was used to calculate correlation coefficients. ns= not significant, $*$ = $p<0.05$ and $***$ = $p<0.001$.

Supplementary Figure 6. Neutralizing antibodies detected in the saliva of vaccinated subjects

Saliva from MSB-1 (A,B,C) or MSB-2 (D,E) was assessed for the presence of neutralizing antibodies and results were expressed as a percentage of maximum infection, where a lower percentage indicates decreased infection of hACE-2 HEK293 cells by rVSV-eGFP-SARS-CoV-2-Spike. (A)- Longitudinal assessment of a subset of MSB-1 subjects (n=9). (B)- Neutralization potential at different dilutions of saliva from n=30 MSB-1 participants. (C)- Fluorescent reduction neutralization titre (FRNT) using a cut off of either 50% or 70% neutralization (FRNT50 and FRNT70, respectively) from n=30 MSB-1 participants. (D)- Neutralization potential at different dilutions of saliva from n=36 MSB-2 participants. (E)- Fluorescent reduction neutralization titre (FRNT) using a cut off of either 50% or 70% neutralization (FRNT50 and FRNT70, respectively) from n=36 MSB-2 participants. Mann-Whitney U test was used to calculate significance between groups, where ns=not significant.

Supplementary Table 3a. Bivariate and multivariable analysis examining potential independent associations between log-transformed saliva anti-Spike IgA.

	Bivariate analysis	Multivariable analysis
Predictor	Beta coefficient (95% CI)	Beta coefficient (95% CI)
Age in years	0.02 (0.01 to 0.04)	0.02 (0.002 to 0.04)
Male sex	-0.4 (-1.1 to 0.3)	-0.4 (-1.1 to 0.3)
Time from vaccination to sample collection in days	0.01 (-0.03 to 0.05)	0.01 (-0.03 to 0.05)
Prior SARS-CoV-2 infection	1.0 (0.4 to 1.5)	0.9 (0.3 to 1.4)

Supplementary Table 3b. Bivariate and multivariable analysis examining potential independent associations between saliva anti-Spike IgG.

	Bivariate analysis	Multivariable analysis
Predictor	Beta coefficient (95% CI)	Beta coefficient (95% CI)
Age in years	0.6 (-0.1 to 1.2)	0.4 (-0.2 to 1.1)
Male sex	-38.7 (-65.2 to -12.2)	-39.5 (-65.7 to -13.3)
Time from vaccination to sample collection	-0.9 (-4.7 to 2.8)	-0.4 (-1.9 to 1.1)
Prior SARS-CoV-2 infection	21.3 (-0.3 to 42)	19.7 (-1.5 to 41)

Supplementary Table 3c. Bivariate and multivariable analysis examining potential independent associations between log-transformed serum anti-RBD IgA.

	Bivariate analysis	Multivariable analysis
Predictor	Beta coefficient (95% CI)	Beta coefficient (95% CI)
Age in years	0.005 (-0.006 to 0.02)	0.0008 (-0.01 to 0.01)
Male sex	0.2 (-0.2 to 0.7)	0.2 (-0.3 to 0.6)
Time from vaccination to sample collection	-0.04 (-0.06 to -0.01)	-0.04 (-0.06 to -0.01)
Prior SARS-CoV-2 infection	0.5 (0.1 to 0.9)	0.5 (0.2 to 0.9)

Abbreviations: CI = confidence interval
