

Figure S1: Proportion of variance of smoking initiation explained by PGS (R^2) in the training sample ($N=7,431$) for different P -value thresholds. P -value threshold = 0.0183001 generates the best-fit PGS with $R^2 = 0.014$.

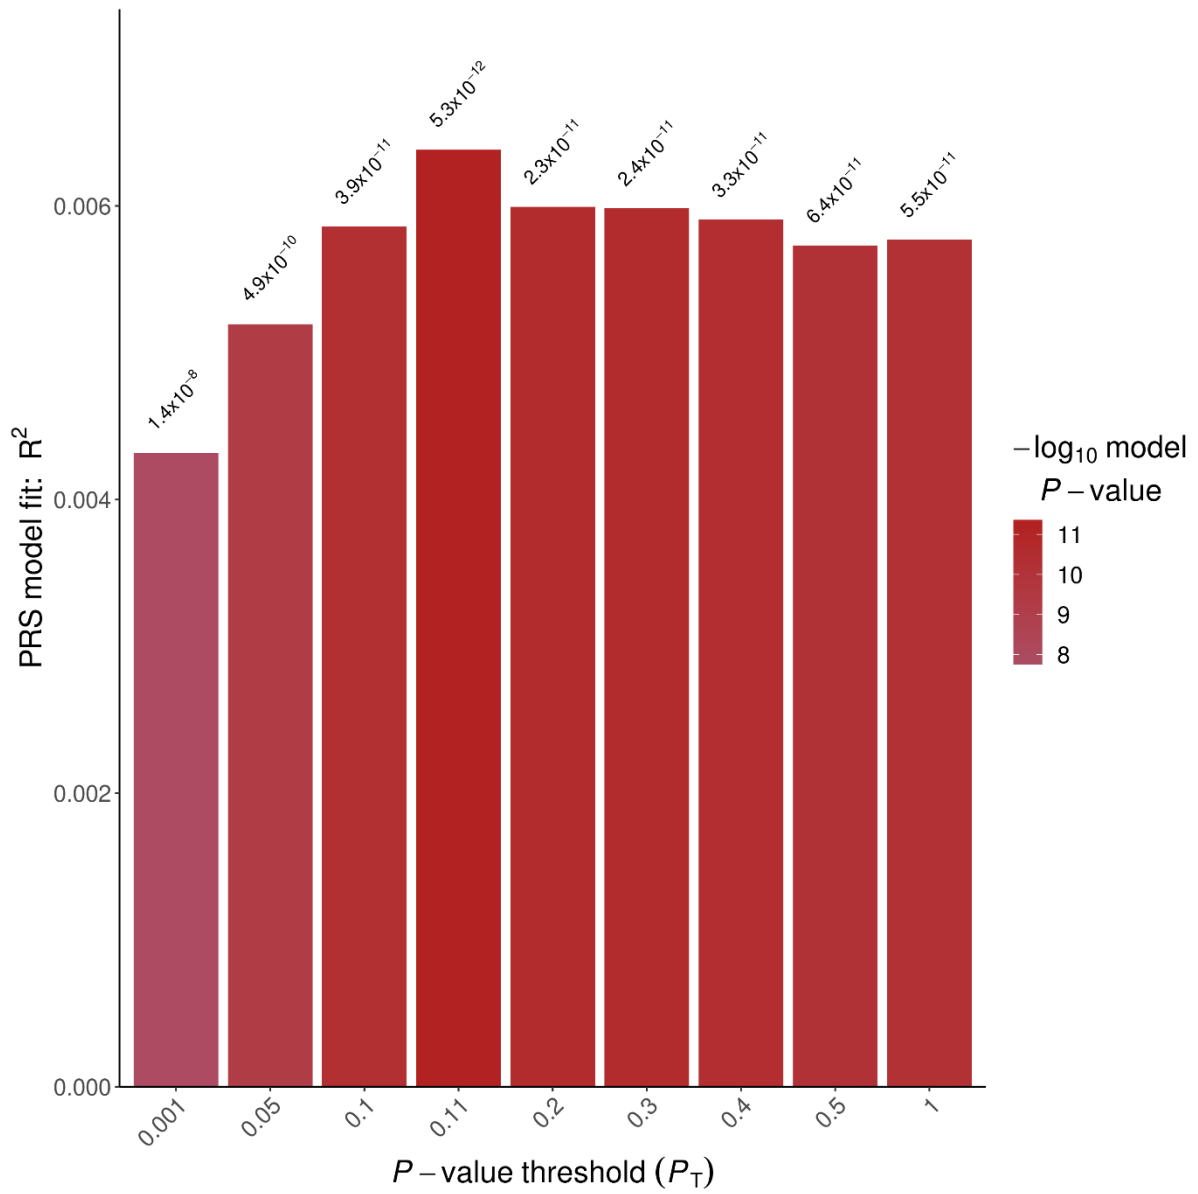

Figure S2: Proportion of variance of alcohol consumption last week explained by PGS (R^2) in the training sample ($N=7,431$) for different P -value thresholds. P -value threshold = 0.11 generates the best-fit PGS with $R^2 = 0.0064$.

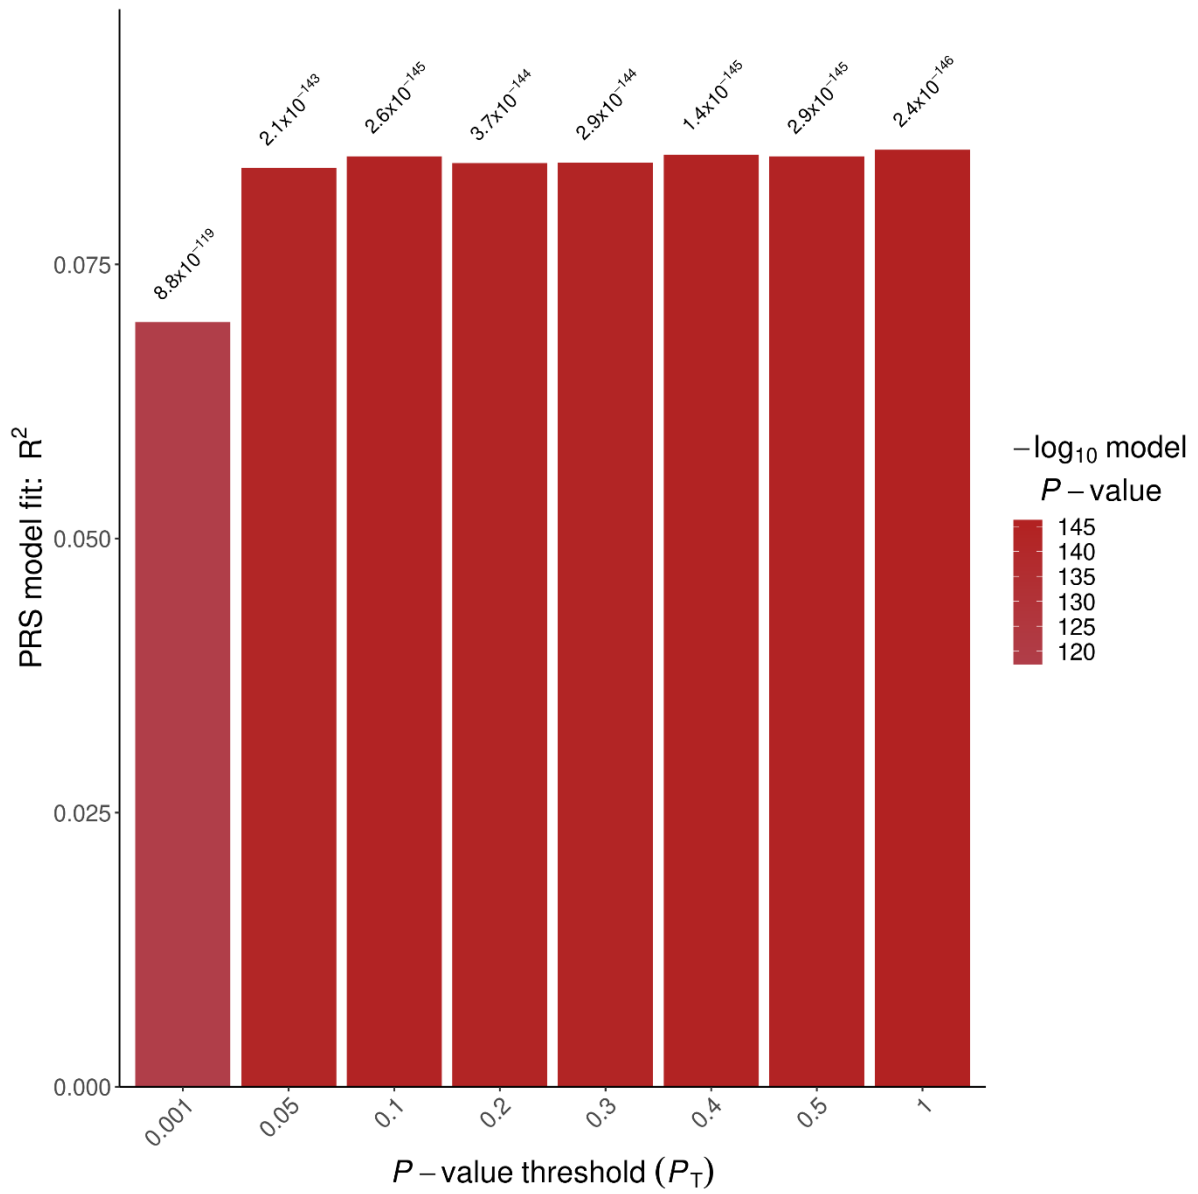

Figure S3: Proportion of variance of BMI explained by PGS (R^2) in the training sample ($N=7,431$) for different P -value thresholds. P -value threshold = 1 generates the best-fit PGS with $R^2 = 0.0855$.
