

**Suppl. Table S1. Macroscopic and biochemical characteristics of mice classified by the SAF score.** Mice were classified according to their liver histological findings, and with independence of their time on diet or administration of CCl<sub>4</sub>, into four groups: non-NAFLD, simple steatosis (NAFL), steatohepatitis without significant fibrosis, stage of fibrosis F0-F1 (NASH) and steatohepatitis + stage of fibrosis F2-F4 (NASH-fibrosis). Values are expressed in mean  $\pm$  SD (N, number of animals). (a) Significant,  $p < 0.05$  from non-NAFLD. (b) Significant,  $p < 0.05$  from NAFL. (c) Significant,  $p < 0.05$  from NASH. (d) Significant,  $p < 0.05$  from NASH-fibrosis. ALT, alanine aminotransferase; AST, aspartate aminotransferase; LW, Liver weight, BW, body weight; HDLc, high-density lipoprotein cholesterol; FFA, free fatty acids.
