

Supplemental Figure 1. Kaplan-Meier Plots Exploring Relationships with Time to Next Pulmonary Exacerbation. Patients were stratified into evenly sized groups as shown in each panel legend for (A) 5-Year Prognostic Risk Score, (B) Number of Pulmonary Exacerbations in the year prior to enrollment, (C) Weight-for-age z-score and (D) FEV₁%. Groups are equal in size except for number of prior exacerbations because those values are ordinal and do not allow more even distribution.
