

145 **Supplemental Figure 3. False Discovery Rate Analysis of Potential Biomarkers for Associations with FEV₁%** Using the *p*-values
 146 of each inflammatory marker from univariable linear regression models for FEV₁%, we ranked the potential biomarkers by *p*-value
 147 and drew lines with slopes determined by the threshold for false discovery (set to 0.05, 0.01 and 0.001) divided by the number of
 148 potential biomarkers in the entire study. Biomarkers falling below a line have chance of being true findings that equal 1 – false
 149 discovery set point for that line. Three biomarkers fall below the FDR 0.001 line, three fall below FDR 0.01 and one falls below the
 150 FDR 0.05 line in this case.
