## Figure 2 A and 2 B : Genetic risk score

Polygenic scores were constructed for diabetes by summing the number of risk alleles carried by each individual, weighted by the effect size estimates from well-established genome-wide significant associations derived from Li et al., (60 SNPs)

- We differentiate idiopathic from diabetic gastroparesis with a diabetes genetic risk score, result that is statistically significant ( $p$-value<0.0004).
- We also recapitulate a number of known significant loci implicated in diabetes risk including (HLA-DQB1,HLA-DQA2, EXOC6B) in the idiopathic versus diabetic gastroparesis analysis.

Diabetes risk

## SLC15A4 ns variant rss33990080
