Supplementary Methods

Country-specific examples for determining the decline in new deaths pm

Supplementary Figure 1. Country-specific examples for determining the decline in new deaths pm in the post-peak period. The post-peak period describes the time and duration at which the spread of deaths has dropped below the peak. Linear regression was fit on the monthly data between the peak maximum and the maximum of the minimum that followed the peak. The period after the peak was determined separately for each country, and the slope values were finally included in the linear regression models. Countries were excluded if they a) were unable to reduce their death rates, b) experienced an increase in death rates that exceeded half of the peak height, or c) reached the peak at the end of the observation time (March 2021). Post-peak periods were analyzed for each country separately and, therefore, differed in length.

Determining thresholds and subgroups in DAI

Supplementary Table 1 presents the results of the treatment contrasts of the interaction of DAI and its three subgroups (low, medium, and high). This step is undertaken as an additional step after noticing three trends in data when plotting the SI_{mean} against DAI. The DAI:subgroup interaction shows a significant effect ($\beta=-109.44$, $p<0.05$). Therefore, DAI slope is dependent on the subgroups. This also indicates that the effect of a country's digitalization depends on its relative position within the DAI scale.

Supplementary Table 1. Regression model of interaction effects of DAI and its subgroups.

	β	Std. Error of β	t	p-value
Constant	38.61	10.65	3.627	0.000**
DAI	54.18	36.95	1.466	0.145
medium	32.56	14.28	2.280	0.024*
high	63.74	27.23	2.341	0.021*
DAI:medium	-64.79	40.84	-1.586	0.115
DAI:high	-109.44	49.22	-2.224	0.028*

* $p\leq 0.05$; ** $p\leq 0.001$;

Notes: The regression coefficient (β) is the degree of change in the outcome variable for every one-unit change in the predictor variable. The t-statistic is the regression coefficient divided by its standard error. Digital adoption is expressed in arbitrary units of DAI. The *Constant* in this regression analysis represents the mean value of the low DAI subgroup (the intercept).

Supplementary Fig. 2 shows the subgroup thresholds [0.36; 0.68], obtained from the $n=61$ inferential interaction analyses with linear regression in the range DAI [0.2; 0.8]. The thresholds discriminate the changes in trend in the data and determine the three DAI subgroups (low, medium, and high). In the plot, each bubble represents the p-value from one of the interaction analyses. We considered the continuous flow of a $p\leq 0.05$ to code for the medium subgroup.

Supplementary Figure 2. Classification of thresholds in DAI. We observed three trends in DAI:SI interaction, where the p-value changed from $p\leq 0.05$ (red dots) to $p\geq 0.05$ (turquoise dots). The change in p-values determined the classification of the DAI into three categories (low, medium, and high). The dotted line shows the breaking points in data, respectively, thresholds of the three DAI categories [0.36; 0.68]. The different dot sizes represent the SI:DAI interaction p-values.

Eligibility criteria

Supplementary Table 2. Eligibility criteria. Inclusion and exclusion characteristics of the studies included in the scoping review.

Type of publication and study design	<ul style="list-style-type: none"> - Studies published in a peer-reviewed scientific journal. We exclude articles that are in-press or pre-prints. - Original research, reviews articles, and perspectives. We exclude news, rapid reports and communications, comments, conference abstracts, letters, policy briefs, and guidance, editorials, clinical studies, and articles where we failed to access full text.
Population	<ul style="list-style-type: none"> - All humans
Context	<ul style="list-style-type: none"> - The context of this paper will be global
Language restrictions	<ul style="list-style-type: none"> - All English-language papers
Publication date	<ul style="list-style-type: none"> - Articles published from 01/01/2020 to 03/05/2021
Interventions, exposures	<ul style="list-style-type: none"> - All COVID-19 related (such as clinical features of COVID-19, investigations relating to COVID-19, outcomes relating to COVID-19, associations with COVID-19 incidence, mortality) - Descriptions of and/or applications of digital health technology solutions in the context of COVID-19 OR in the context of population-level public health interventions (it may refer to interventions that were at stake before the pandemic started)
Outcomes	<ul style="list-style-type: none"> - Due to the broad nature of this scoping review, outcome measures analyzing any topic related to COVID-19 and its intersection with digitalization will be included. <p>This will include but is not limited to:</p> <ul style="list-style-type: none"> - COVID-19 outcomes, disease frequencies, and epidemiology (mortality, morbidity, incidence, prevalence, deaths, ...) - Digital technologies used in the COVID-19 pandemic - Digital technologies used before the COVID-19 pandemic - Administrative outcomes (government responses, infrastructure/organization of hospitals, utilization of digital technologies) - Equipment/safety-related (intensive care units, access to hospitals and operating units) - Countries' digital performance (access to digital technologies; adoption, preparedness, and readiness for digital development; digital infrastructure)
Sort and prioritize your exclusion criteria per selection phase (optional)	<p>Selection phase: title/abstract screening</p> <ol style="list-style-type: none"> 1. Not COVID-19 AND/OR digit* related 2. Not English 3. Wrong population 4. Wrong publication type/study design <p>Selection phase: full-text screening</p> <ol style="list-style-type: none"> 1. No full text is accessible 2. Not (primarily) COVID-19 AND/OR digit* related 3. Off-topic: Articles that did primarily focus on digital tools for mitigating COVID-19 4. Wrong outcomes 5. Wrong publication type/study design

Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews

Supplementary Table 3. Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) Checklist.

SECTION	ITEM	PRISMA-ScR CHECKLIST ITEM	REPORTED ON PAGE #
TITLE			
Title	1	Identify the report as a scoping review.	We did not include this information in the title, as the scoping review was one of three methodologies applied.
ABSTRACT			
Structured summary	2	Provide a structured summary that includes (as applicable): background, objectives, eligibility criteria, sources of evidence, charting methods, results, and conclusions that relate to the review questions and objectives.	1
INTRODUCTION			
Rationale	3	Describe the rationale for the review in the context of what is already known. Explain why the review questions/objectives lend themselves to a scoping review approach.	2
Objectives	4	Provide an explicit statement of the questions and objectives being addressed with reference to their key elements (e.g., population or participants, concepts, and context) or other relevant key elements used to conceptualize the review questions and/or objectives.	12
METHODS			
Protocol and registration	5	Indicate whether a review protocol exists; state if and where it can be accessed (e.g., a Web address); and if available, provide registration information, including the registration number.	n.a.
Eligibility criteria	6	Specify characteristics of the sources of evidence used as eligibility criteria (e.g., years considered, language, and publication status), and provide a rationale.	Supplementary Table 2
Information sources*	7	Describe all information sources in the search (e.g., databases with dates of coverage and contact with authors to identify additional sources), as well as the date the most recent search was executed.	12
Search	8	Present the full electronic search strategy for at least 1 database, including any limits used, such that it could be repeated.	Supplementary Note
Selection of sources of evidence†	9	State the process for selecting sources of evidence (i.e., screening and eligibility) included in the scoping review.	Supplementary Table 2
Data charting process‡	10	Describe the methods of charting data from the included sources of evidence (e.g., calibrated forms or forms that have been tested by the team before their use, and whether data charting was done independently or in duplicate) and any processes for obtaining and confirming data from investigators.	12-13
Data items	11	List and define all variables for which data were sought and any assumptions and simplifications made.	Supplementary Table 4
Critical appraisal of individual sources of evidence§	12	If done, provide a rationale for conducting a critical appraisal of included sources of evidence; describe the methods used and how this information was used in any data synthesis (if appropriate).	n.a.
Synthesis of results	13	Describe the methods of handling and summarizing the data that were charted.	12-13
RESULTS			
Selection of sources of evidence	14	Give numbers of sources of evidence screened, assessed for eligibility, and included in the review, with reasons for exclusions at each stage, ideally using a flow diagram.	Supplementary Fig. 3

SECTION	ITEM	PRISMA-ScR CHECKLIST ITEM	REPORTED ON PAGE #
Characteristics of sources of evidence	15	For each source of evidence, present characteristics for which data were charted and provide the citations.	Supplementary Table 3, Supplementary Fig. 4 & 5
Critical appraisal within sources of evidence	16	If done, present data on critical appraisal of included sources of evidence (see item 12).	n.a.
Results of individual sources of evidence	17	For each included source of evidence, present the relevant data that were charted that relate to the review questions and objectives.	n.a.
Synthesis of results	18	Summarize and/or present the charting results related to the review questions and objectives.	Supplementary Table 3
DISCUSSION			
Summary of evidence	19	Summarize the main results (including an overview of concepts, themes, and types of evidence available), link to the review questions and objectives, and consider the relevance to key groups.	3-8 & Supplementary Results
Limitations	20	Discuss the limitations of the scoping review process.	10
Conclusions	21	Provide a general interpretation of the results with respect to the review questions and objectives, as well as potential implications and/or next steps.	9-11
FUNDING			
Funding	22	Describe sources of funding for the included sources of evidence, as well as sources of funding for the scoping review. Describe the role of the funders of the scoping review.	19

JBIG = Joanna Briggs Institute; PRISMA-ScR = Preferred Reporting Items for Systematic reviews and Meta-Analyses extension for Scoping Reviews.

* Where *sources of evidence* (see second footnote) are compiled from, such as bibliographic databases, social media platforms, and Web sites.

† A more inclusive/heterogeneous term used to account for the different types of evidence or data sources (e.g., quantitative and/or qualitative research, expert opinion, and policy documents) that may be eligible in a scoping review as opposed to only studies. This is not to be confused with *information sources* (see first footnote).

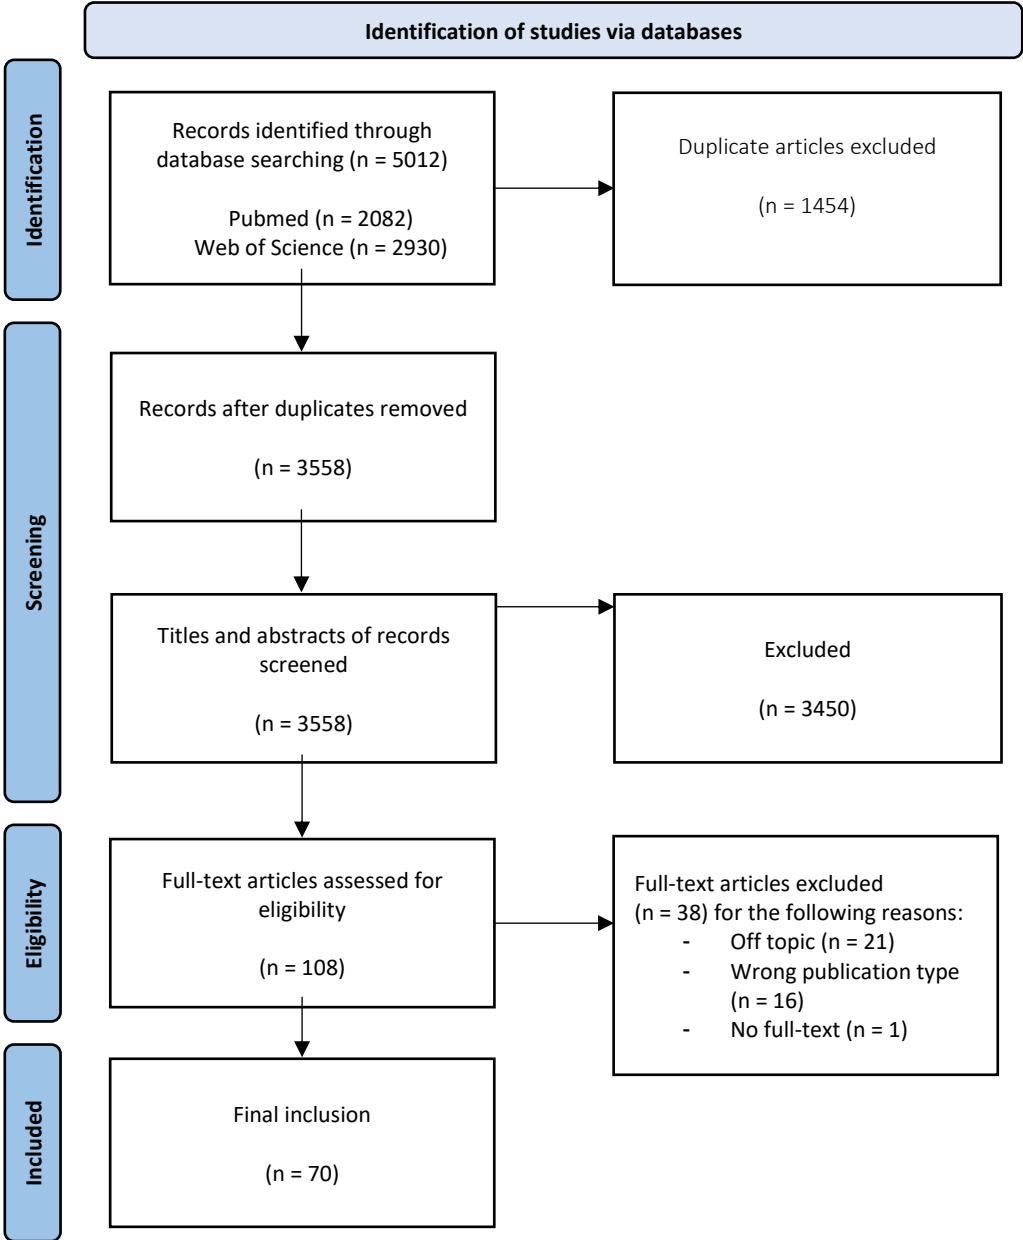

‡ The frameworks by Arksey and O'Malley (6) and Levac and colleagues (7) and the JBI guidance (4, 5) refer to the process of data extraction in a scoping review as data charting.

§ The process of systematically examining research evidence to assess its validity, results, and relevance before using it to inform a decision. This term is used for items 12 and 19 instead of "risk of bias" (which is more applicable to systematic reviews of interventions) to include and acknowledge the various sources of evidence that may be used in a scoping review (e.g., quantitative and/or qualitative research, expert opinion, and policy document).

From: Tricco AC, Lillie E, Zarin W, O'Brien KK, Colquhoun H, Levac D, et al. PRISMA Extension for Scoping Reviews (PRISMA-ScR): Checklist and Explanation. *Ann Intern Med.* 2018;169:467–473. doi: 10.7326/M18-0850.

Note: Totals reported in the results section of the manuscript correspond to the number of papers to which at least one of the three keywords could be assigned per topic: i) healthcare system (n=26), ii) government responses (n=46), and iii) determinants facilitating or hindering public health outcomes (n=19).

Literature findings of the scoping review: Determinants facilitating or hindering public health outcomes

For the final theme of our scoping review, we combined the literature discussing influential factors that hindered or facilitated the early response to the pandemic and that do not directly relate to digital technologies used in clinical settings or by governments. Three keywords emerged under this theme: socioeconomic and political contexts, risk communication, and public attitudes. Supplementary Fig. 3 shows the occurrence and overlap of all nine keywords included in the scoping review. Large disparities in affordability and access to mobile communications widen the digital divide¹⁴. Low-income settings, ethnic minorities, less educated groups, and the digitally illiterate are disproportionately affected by digital inequalities⁵⁰. Reddick et al. illustrate this with a case study of broadband access in San Antonio, USA, where more than half the population is Hispanic. Residents of poorer neighborhoods had significantly lower rates of broadband use, defined here as an essential factor in a person's quality of life. This study highlights the significant digital divide within geographic structures⁵⁰. Anthony et al. identified barriers to adopting digital health solutions at the infrastructural and institutional level, similar to the DAI pillars. They ultimately created determinants meaningful in adopting telehealth⁸. In addition, great exposure to information, inappropriate risk communication, or even misinformation have confused and influenced individual health behaviors. Misinformation and changing guidance have led people to reject public health measures such as wearing masks and physical distancing^{14,60}. Finally, digital technologies raise legal, ethical, and privacy concerns^{8,57}.

Supplementary Figure 6. Occurrence of keywords and themes within the scoping review. The radar chart illustrates the frequency and overlap of studies assigned to the following three themes of the scoping review: i) health care system, ii) government responses, and iii) determinants facilitating or hindering public health outcomes. The results of the first two themes are extensively described in the main manuscript. The third theme (green) includes keywords from all three themes. The axis of the radar chart represents the total number of included keywords within the themes (see Supplementary Table 5). The scale for the radial axes of this chart is the total number of reports per keyword.

Global level of digital adoption by income

Supplementary Figure 7. Distribution of digital adoption by income group. Box and Whisker plot of the digital adoption index (DAI) by income level: low, lower-middle, upper-middle, and high income. One-way ANOVA of income groups followed by a Games-Howell post-hoc test for pairwise comparisons. DAI showed statistically significant differences between all groups ($p < 0.001$). (Note: LIE = low-income economy; LMIE = lower-middle-income economy; UMIE = upper-middle-income economy; HIE = high-income economy).

Supplementary Table 6. Post-hoc comparison of means between income groups.

group 1	group 2	t	p-value (adj.)
HIE	LIE	-36.532	0.0001*
HIE	LMIE	-24.341	0.0001*
HIE	UMIE	-11.965	0.0001*
LIE	LMIE	10.246	0.0001*
LIE	UMIE	18.187	0.0001*
LMIE	UMIE	8.889	0.0001*

* $p < 0.0001$
