z Score values indicate how many standard deviations have the post-intervention values changed with respect to the baseline mean and standard deviation. E.g., a 0.50 z Score means that the mean value at post-intervention is 0.50 standard deviations higher than the mean value at baseline, indicating a positive change, with negative values indicating the opposite. Values are expressed as mean (95% CI). Analyses were adjusted for baseline values. N=81 participants. Raw scores values are expressed in Normalized Protein eXpression (NPX) units. This means that a high NPX value equals a high protein concentration. Because NPX is in a log<sub>2</sub> scale, a 1 NPX difference means a doubling of protein concentration. If needed NPX values can be converted into linear scale: 2NPX= linear NPX. Abbreviations:  $p_{FDR}$ = adjusted for multiple comparisons using false discovery rate.

z Score values indicate how many standard deviations have the post-intervention values changed with respect to the baseline mean and standard deviation. E.g., a 0.50 z Score means that the mean value at post-intervention is 0.50 standard deviations higher than the mean value at baseline, indicating a positive change, with negative values indicating the opposite. Values are expressed as mean (95% CI). Analyses were adjusted for baseline values. N=87 participants. Raw scores values are expressed in Normalized Protein eXpression (NPX) units. This means that a high NPX value equals a high protein concentration. Because NPX is in a log<sub>2</sub> scale, a 1 NPX difference means a doubling of protein concentration. If needed NPX values can be converted into linear scale: 2<sup>NPX</sup>= linear NPX. Abbreviations: *p*<sub>FDR</sub>= adjusted for multiple comparisons using false discovery rate.
