

**Supplementary Methods S1 Classification of energy level,
effect size and study conclusion**

Energy level,

Classification of energy level through energy flux density or pressure field.

Energy level	Physical parameter	Specific dosage (mJ/mm ² or bar)
High energy	Energy flux density	$0.28 \leq x < 0.60$
	Pressure field	$x > 2.5$
Medium energy	Energy flux density	$0.08 \leq y < 0.28$
	Pressure field	$1.5 \leq y \leq 2.5$
Low energy	Energy flux density	$z < 0.08$
	Pressure field	$z < 1.5$

Note: x, high energy; y, medium energy; z, low energy.

Effect size,

Classification of effect size through specific scope regarding risk ratio and standardised mean difference.

Estimated summary effect	Effect size	Specific scope
Relative risk	Large	$a \geq 2.0$
		$a \leq 0.5$
	Small	$0.5 < a < 2.0$
Standardized mean difference	Large	$b \geq 0.8$
		$b \leq -0.8$
	Moderate	$0.5 \leq b < 0.8$
		$-0.8 < b \leq -0.5$
	Small	$0.2 \leq b < 0.5$
		$-0.5 < b \leq -0.2$
Very small	$-0.2 < b < 0.2$	

Note: a, relative risk; b, standardized mean difference.

Study conclusion,

Classification of study conclusion corresponding to each outcome.

Conclusion class	Description
Positive	Results reported a positive effect compared to the control group and conclusion indicated that the intervention was effective.
Potentially positive	Results reported a positive or potentially positive effect compared to the control group and conclusion indicated that the intervention was potentially effective.
Unclear	Results reported a effect or not compared to the control group and conclusion did not indicate the intervention.
No effect	Results reported no effect compared to the control group and conclusion indicated the intervention was invalid.
Potentially negative	Results reported a negative or potentially negative effect compared to the control group and conclusion indicated that the intervention was potentially adverse.
Negative	Results reported a negative effect compared to the control group and conclusion indicated that the intervention was adverse.
