

Supplementary Figure 1. Sex-specific proteomic associations for incident CAD. (a) Female- and (b) male-specific volcano plots representing the effect size of combined-sex plasma-proteomic profiles for CAD ($\text{FDR} < 0.05$, $\text{abs}(\beta) \geq 0.15$). Orange and purple dots respectively denote positive and negative significant associations with incident CAD. The proteins were part of the Cardiometabolic, Cardiometabolic_II, Inflammation, Inflammation_II, Neurology, Neurology_II, Oncology, and Oncology_II panels of the Olink Explore 3072 platform

Supplementary Figure 2. Post-menopausal analyses for protein associations with CAD. Beta-beta plots for restriction (a) and (b) adjustment of women for postmenopausal status, relative to the non-adapted female-specific model.
