

Fig. S4. Chromosomal distribution of sperm DMRs. Chromosomal localization of either hyper- or hypomethylated DMRs, plotted based on Stephen Turner's "qqman" R package [1]. DMRs obtained using "bsseq" and "metilene" with a methylation difference (y-axis) ranging from 0% (0) to 100% (1/-1) with a minimum methylation difference of 30% (0.3/-0.3) between groups. Chromosomes 1-22 + "X" on the x-axis. No DMRs could be observed on the Y Chromosome, which is not shown. Contrastingly coloured columns and dots refer to the different chromosomes.
