S2

Parametrisation of incubation period distributions and prior information

Weibull distribution

Weibull(λ, k) with mean $\lambda\Gamma(1 + 1/k)$ and variance $\lambda^2 [\Gamma(1 + 2/k) - \Gamma(1 + 1/k)^2]$
using strictly positive, flat prior probabilities on scale parameter λ and shape parameter k .

Gamma distribution

Gamma(k, θ) with mean $k\theta$ and variance $k\theta^2$
using strictly positive, flat prior probabilities on the mean $k\theta$ and shape parameter k .

Lognormal distribution

Lognormal(μ, σ) with mean $\exp(\mu + \sigma^2/2)$ and variance $[\exp(\sigma^2) - 1] \exp(2\mu + \sigma^2)$
using strictly positive, flat prior probabilities on the logmean μ and logsd σ .
