N transmissison scenarios identifying
county as being at or above 90% quantile
of per capita hospitalizations

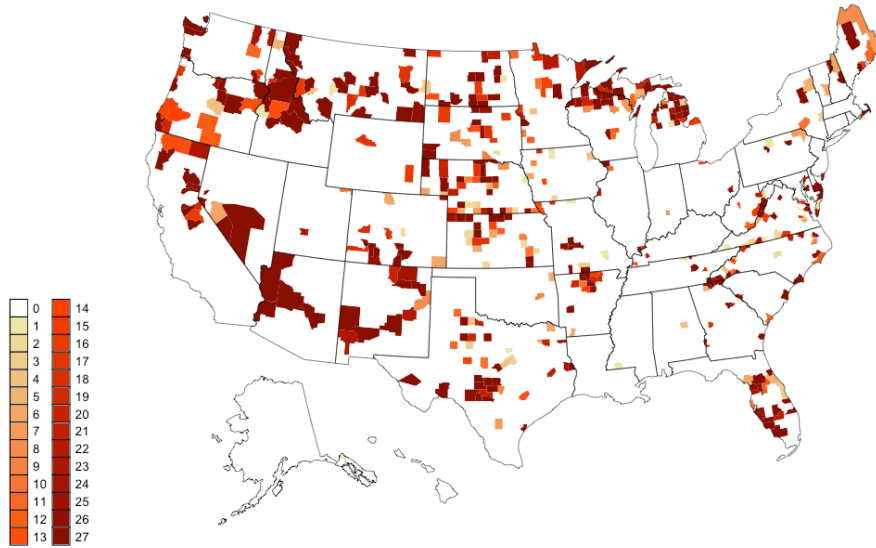

Figure S1: Counties at or above 90% quantile of per capita hospitalizations

For each of 27 transmission scenarios, we simulated our model and calculated the burden of COVID-19 infection. Colors indicate the number of transmission scenarios in which each county was identified as being at or above the 90% quantile of per capita hospitalizations.

N transmission scenarios identifying
county as being at or above 90% quantile
of hospitalizations per hospital bed

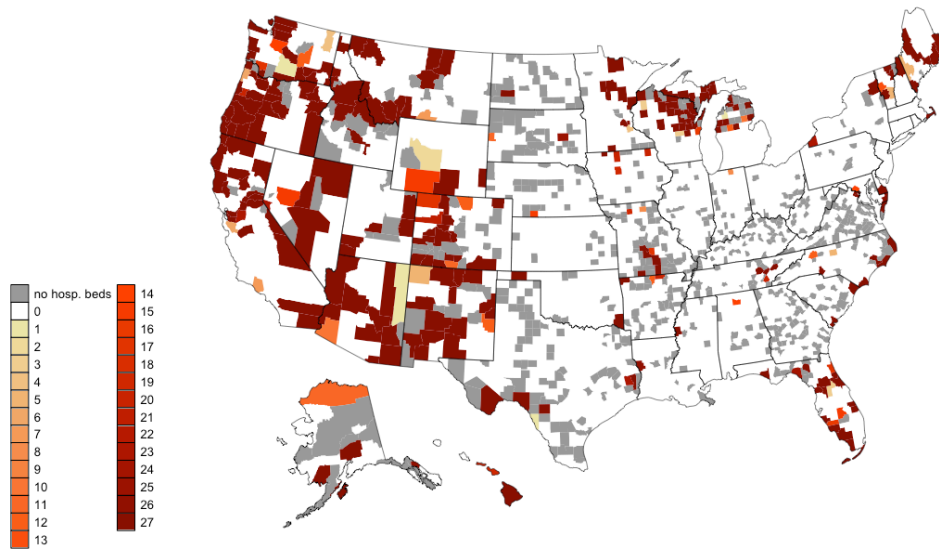

Figure S2: Counties at or above 90% quantile of hospitalizations per hospital bed
For each of 27 transmission scenarios, we simulated our model and calculated the burden of COVID-19 infection. Colors indicate the number of transmission scenarios in which each county was identified as being at or above the 90% quantile of hospitalization per hospital bed. Counties without hospital beds are colored grey.

N transmission scenarios identifying
county as being at or above 90% quantile
of per capita ICU admissions

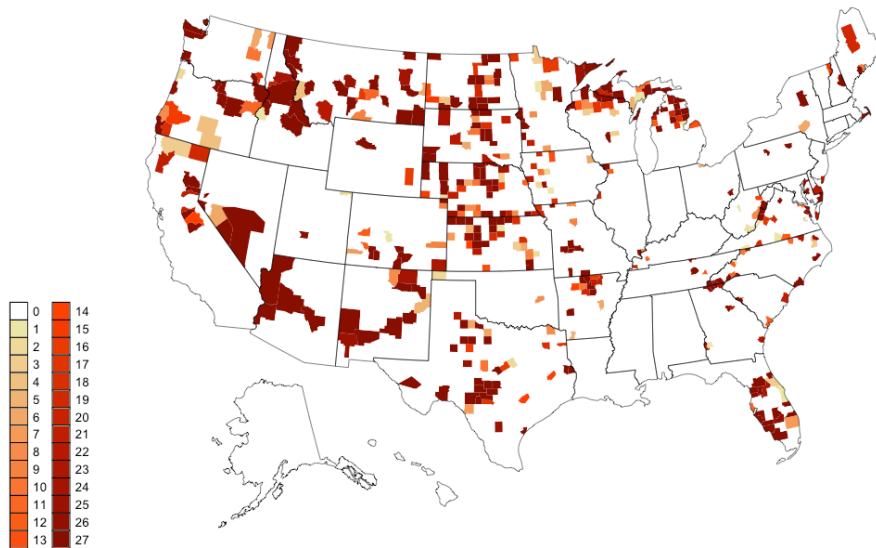

Figure S3: Counties at or above 90% quantile of per capita ICU admissions
For each of 27 transmission scenarios, we simulated our model and calculated the burden of COVID-19 infection. Colors indicate the number of transmission scenarios in which each county was identified as being at or above the 90% quantile of ICU admissions per capita.

N transmission scenarios identifying county as being at or above 90% quantile of ICU admissions per ICU bed

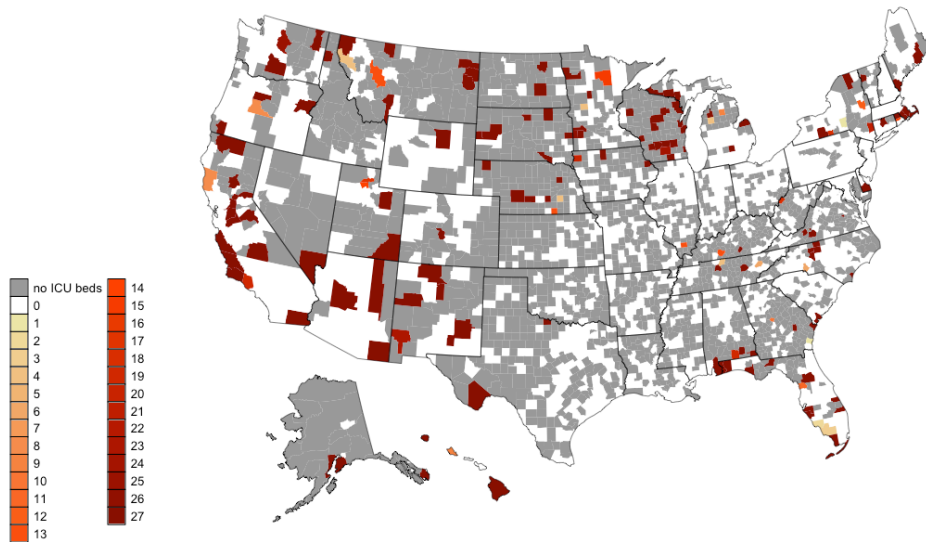

Figure S4: Counties at or above 90% quantile of per capita ICU admissions per ICU bed
For each of 27 transmission scenarios, we simulated our model and calculated the burden of COVID-19 infection. Colors indicate the number of transmission scenarios in which each county was identified as being at or above the 90% quantile of ICU admissions per ICU bed. Counties without ICU beds are colored grey.
