

**Supplementary Figure 1. S and N IgG responses by ELISA and LIPS.** (A) full S IgG ELISA for COVID-19 patients and healthy controls. (B) Pearson Spearman correlation of full S ELISA and LIPS of COVID-19 patients. (C) N IgG ELISA for COVID-19 patients and healthy controls. (D) Pearson Spearman correlation of N ELISA and LIPS of COVID-19 patients. Data represents the mean +/- stdev, and individual responses (n=15). Experiments were repeated twice. P values were calculated using the Mann-Whitney U test. \* shows statistical significance between COVID-19 patients versus healthy controls. \*p<0.05, \*\*p<0.01, \*\*\*p<0.001.

**Supplementary Figure 2. Absence of sex- and age-related effect on the production of SARS-CoV-2 antibodies by LIPS.** Antibodies against SARS-CoV-2 antigens were measured by LIPS in COVID-19 patients and stratified by gender (a) and age (<60, and >60 years of age) (b). Data represents the mean +/- stdev, and individual COVID-19 responses (n=15). Experiments were repeated twice. P values were calculated using the Mann-Whitney U test. \* shows statistical significance between COVID-19 patients versus healthy controls. \*p<0.05, \*\*p<0.01, \*\*\*p<0.001.
