

Supplementary material 2: Incidence of confirmed and symptomatic cases in residents according to Datix incident reports

Datix incidents reports recorded that 928 residents were tested at least once. Test results were known for 828 of them (89.2%), including 617 residents with a positive test result. This data should be treated as representative, as tests coming back negative were not commonly recorded on Datix. Incidence proportions and rates reported in Table 8 are lower than corresponding estimates based on outbreak counts. This is thought to be caused by a combination of under-ascertainment as well as linkage error.

Table 8: Incidence proportions and rates of SARS-CoV-2 infections amongst residents according to Datix incident reports (2 Mar 2020-14 Jun 2020)

Residents	Symptomatic	Confirmed	All-cause death
Cases	1,045	617	1,694
<i>N</i> exposed	8,713	8,713	8,713
Total exposure (days)	708,787	726,009	746,090
Cumulative incidence (%)	12.0 [11.3; 12.7]	7.1 [6.6; 7.6]	19.4 [18.6; 20.3]
Incidence rate (per 100,000)	147.4 [138.6; 156.7]	85.0 [78.4; 92.0]	227.1 [216.4; 238.1]
