

Supplement S1: Parameter values of the model published on 30/4

Parameter name	Resulting value	Range for calibration (30/4/2020)	
		min	max
beta1	0.66	Parameter value calibrated in previous model editions	
beta2	0.46		
beta3	0.32		
beta4	0.25 (95% CI 0.23-0.27)*	0.20	0.30
beta5	0.18 (95% CI 0.12-0.23)*	0.05	0.30
eftest1	0.14	Parameter value calibrated in previous model editions	
eftest2	0.49		
subcl_prop	0.10	Assumption	

\* 5 percent of best fitting simulations were accepted for parameter estimation.

Values **beta1** to **beta5** correspond to a 1/4 of the respective effective reproduction number (i.e., the number of individuals infected by 1 infected individual every day, assuming the total length of the period of infectiousness to be 4 days) in respective periods:

- beta1 (by 6 March)
- beta2 (7-11 March)
- beta3 (12-15 March)
- beta4 (16-30 March)
- beta5 (since 1 April)

Values **eftest1** to **eftest2** correspond to the transition probability from  $I_{8+}$  to R in the respective periods:

- eftest1 (by 22 March)
- eftest2 (since 31 March)

(values in the transition period were linearly interpolated)

Value **subcl\_prop** corresponds to the transition probability from  $I_7$  to  $R_{subcl}$
