

Blood pressure and cognitive function across the eighth decade: a prospective study of the Lothian Birth Cohort of 1936

Supplementary Materials

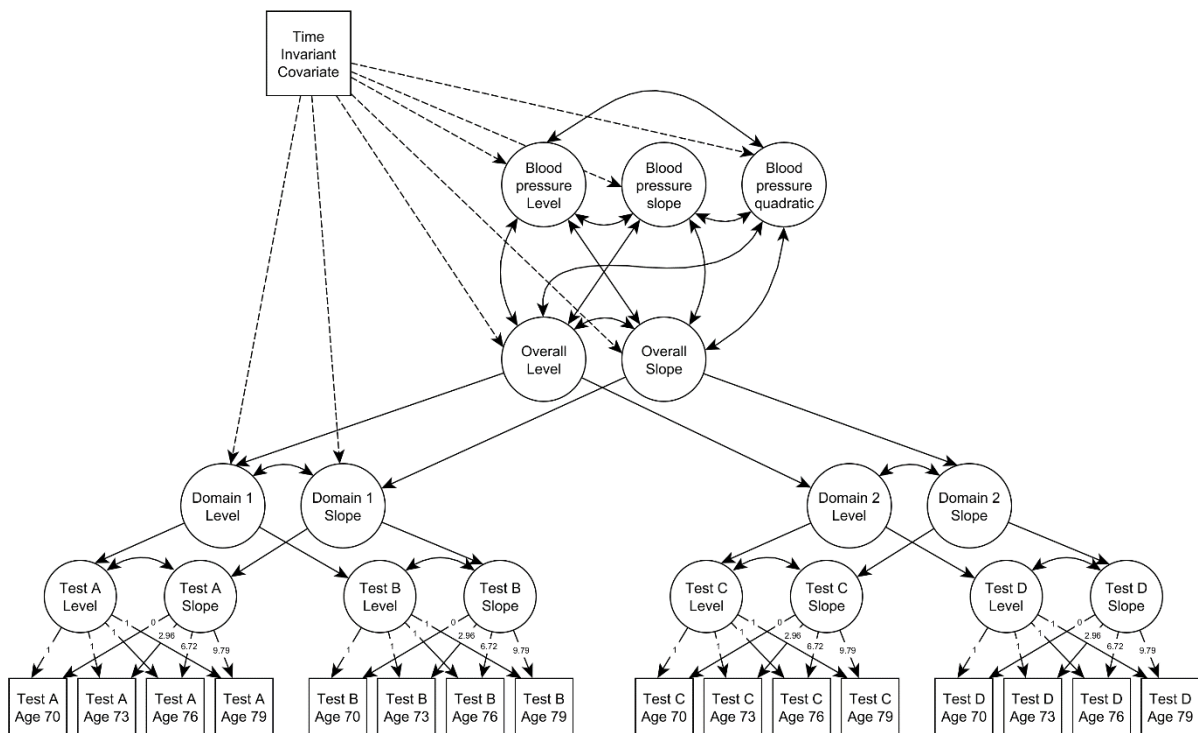

Supplementary Figures 1, 2

Supplementary Tables 1 – 3

Supplementary Figure 1. Simplified path diagram of the hierarchical curve of factors latent growth model of blood pressure change in the LBC1936. Circles represent latent variables and squares represent measured variables. Growth curves, including latent level, linear slope, and quadratic slope factors, were estimated from both systolic and diastolic reading. Basis coefficients (loadings on the individual test slopes) were fixed at 0, 2.96, 6.72, and 9.79 for the linear slopes and 0, 8.76, 45.16, and 95.84 for the quadratic slopes to precisely reflect the amount of time passing between assessments. Dashed lines indicate the relationships between covariates which differed between waves and their effects on the individual measurements at different waves. To preserve interpretability, not all variables and paths are shown. Solid, double arrowed lines indicate correlations between latent variables. Dashed lines ending in diamonds represent systolic and diastolic measurements, modelled the same way as at age 70.

Supplementary Figure 2. Simplified path diagram of the bivariate growth curves of blood pressure and cognitive function, as well as the underlying structure of cognitive function. Circles represent latent variables and squares represent measured variables. Latent variables for blood pressure were modelled as shown in Figure 1. Growth curves, including a latent level and linear slope factor, were estimated for each cognitive test, and the intercepts and slopes were analyzed in a hierarchical model which contained domain and overall factors of both level and slope. Basis coefficients (loadings on the individual test slopes) were fixed at 0, 2.96, 6.72, and 9.79 to precisely represent the amount of time passing between assessments. Dashed lines indicate the relationships between covariates which were fixed across waves and the overall and domain latent variables. To preserve interpretability, not all covariate relationships are shown. Solid, double arrowed lines indicate correlations between latent variables. Although only two domains and four tests are shown here, the full model used all fourteen tests and four domains, as described in the Methods.

Supplementary Table 1. Descriptive statistics for cognitive, demographic, and clinical variables from study completers only (n = 539).

	Wave 1	Wave 2	Wave 3	Wave 4
Female	267 (49.5%)	-	-	-
Ever had high BP	193 (35.8%)	256 (47.5%)	286 (53.1%)	314 (58.3%)
Ever had CVD	123 (22.8%)	151 (28.0%)	185 (34.3%)	198 (36.7%)
Ever had stroke	18 (3.33%)	31 (5.75%)	55 (10.2%)	69 (12.5%)
Current smoker	24 (4.54%)	22 (4.08%)	19 (3.52%)	21 (3.90%)
Ex-smoker	226 (41.9%)	228 (42.3%)	222 (41.2%)	229 (42.4%)
Average sitting systolic BP	147.7 (17.63)	147.7 (18.18)	147.7 (18.75)	145.1 (18.7)
Average sitting diastolic BP	81.0 (9.53)	77.9 (9.53)	79.0 (10.3)	76.8 (10.1)
Years of education	10.9 (1.17)	-	-	-
Age 11 IQ	102.2 (15.15)	-	-	-
Matrix Reasoning*	14.7 (5.02)	13.2 (4.89)	13.3 (4.91)	13.0 (5.02)
Block Design*	35.7 (10.1)	34.7 (10.1)	32.7 (9.79)	31.3 (9.66)

LHS = Left-hand side (of the structural equation); RHS = right-hand side. The path column indicates the type of relationship between the two variables, ~ indicates a regression, and ~~ indicates a correlation or covariance.
