Figure S1. Determination of assay cut-off. (A) Representative signal curves produced by CRISPR-nCoV. A positive control (red), a negative control (black) and clinical samples (blue) were shown with distinct positive or negative curve patterns (B) Fold-change values by CRISPR-nCoV obtained from our prospective cohort. Positive, i.e. ones with take-off signal curves were in red; Negative, i.e. ones with flat curves were in blue. A cut-off of 3,0 was set and indicated in black dashed line.
