SUPPLEMENTARY TABLES	XLSX
<i>METABOLOMICS RESULTS: RELATIVE QUANTIFICATION</i>	<i>SHEET 1</i>
<i>METABOLOMICS RESULTS: ABSOLUTE QUANTIFICATION</i>	<i>SHEET 2</i>
<i>PROTEOMICS RESULTS: PEAK ANALYSIS OF PROTEINS</i>	<i>SHEET 3</i>
<i>PROTEOMICS RESULTS: PEAK ANALYSIS OF PEPTIDES.....</i>	<i>SHEET 4</i>
<i>LIPIDOMICS RESULTS</i>	<i>SHEET 5</i>

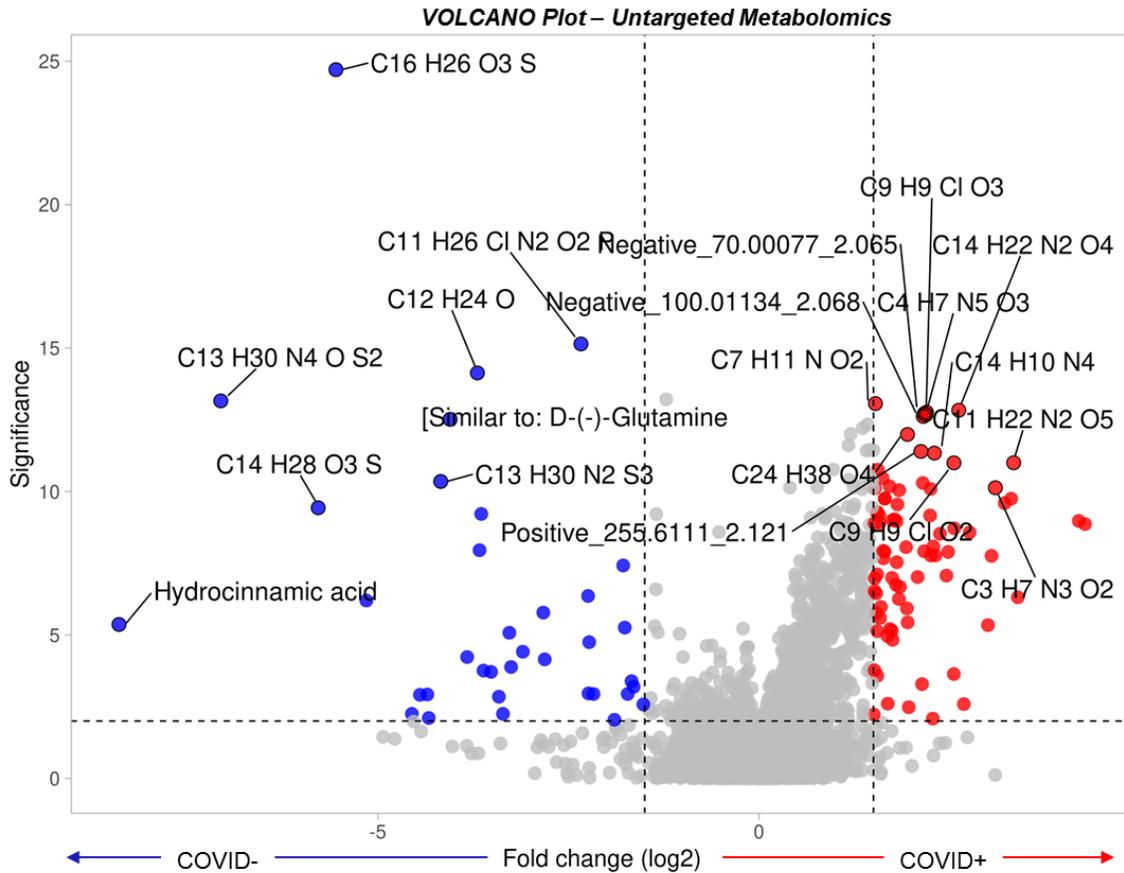

Supplementary Figures

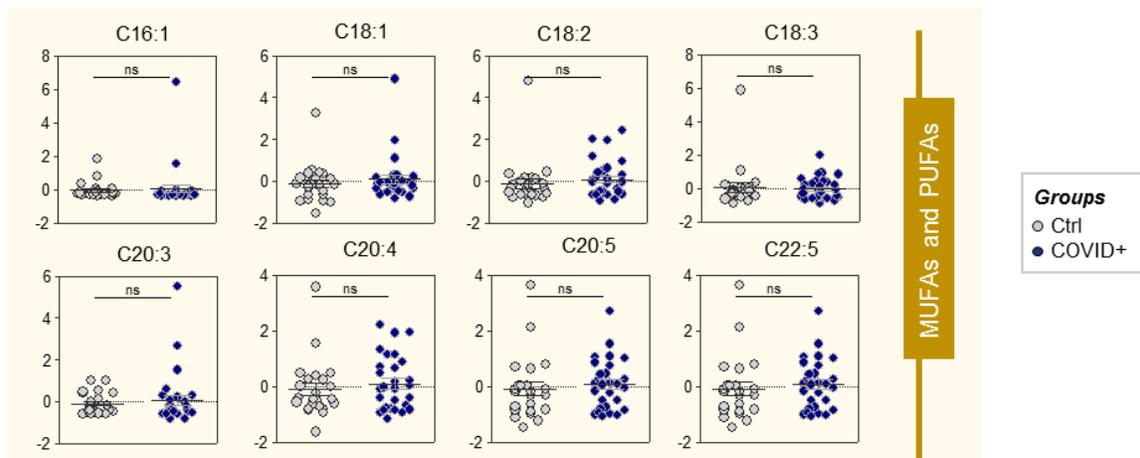

Supplementary Figure 1 – No significant effects of COVID-19 were seen on classic clinical hematology parameters, except for increases in mean corpuscular volume ($p < 0.05$ One-tailed t-test) and a non-significant trend towards increase in HCT and Hgb (g/dl)

Supplementary Figure 2 – Vectorial version of Top 50 Metabolites by t-test in RBCs from COVID-19-positive patients, as compared to controls

Supplementary Figure 3 – Vectorial version of Top 50 Proteins by t-test in RBCs from COVID-19-positive patients, as compared to controls

Supplementary Figure 4 – VOLCANO PLOT of Untargeted Metabolomics data from RBC analysis of COVID-19-positive patients, as compared to controls

Supplementary Figure 5 – COVID-19 did not significantly affect levels of mono- and poly-unsaturated fatty acids in RBCs.
