

Supplementary Figure 1. Kinetics of SARS-CoV-2 specific antibodies over time based on disease severity. OD values of S1- and N-specific IgG and IgM (S1-IgG, S1-IgM, N-IgG and N-IgM) and neutralizing titers (IC₅₀) are plotted against the days post disease onset. The line and the ribbon show the mean expected from a LOESS regression model with 95% confidence interval for each disease severity category. The colored circles indicate disease severity. OD = optical density.
